NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 12⅝@12¾c.; Lake, 13c.; casting, 12⅝@12¾c.

The South Side Street Railway, Chicago, is about to substitute electricity for cable power on its lines.

The Electric Storage Battery Company of Philadelphia has brought a suit in the United States Circuit Court at Boston against the Hatch Storage Battery Company to restrain the defendants from infringing on patents owned by the plaintiff.

The Edison Electric Illuminating Company of New York reports for October: Gross earnings, $253,897, increase over the same month in 1897, $39,317; operating expenses and taxes, $135,589, increase $24,407; net earnings, $118,308, increase $14,-909; surplus, $73,733, increase $9,409.

The Keely Motor Company directors held a brief session after attending the funeral of the inventor in Philadelphia on the 23d inst., adopted resolutions expressing faith in the ultimate success of Keely's alleged discovery, and suggesting that Thomas A. Edison, the electrical inventor, be invited to assist in completing the work.

The annual report of the Boston Elevated Railway Company, which covers the operations of the West End Street Railway Company, shows that for the year ending September 30 the company earned enough to pay all charges, including dividends on the West End Street Railway and 2½ per cent. on $5,000,000 Elevated stock, and leave a balance of $214,077.

A committee consisting of George W. Young, Walter G. Oakman, James Timpson and Edward C. Jones has prepared a plan for the reorganization of the Elmira Municipal Improvement Company, owner of the Elmira & Horseheads Railway, gas, electric light and waterworks at Elmira, N. Y. Copies may be obtained from the depositary, the United States Mortgage & Trust Company, 59 Cedar street, New York.

A contract for the construction of 150 new open cars has been made by the Brooklyn Heights Railroad Company with the St. Louis Car Company. The cars will be the large sized variety introduced on the lines last year and will be 36 feet long, with 13 reversible benches and with a seating capacity of 75. The cars will be delivered next spring and all the down town lines will be equipped with them. All the old style cars will be taken off and either sold or destroyed.

The consolidation of the leading electric companies of Baltimore, Md., is rapidly being pushed to completion. It is announced that in a short time the new company will place on the market $4,000,000 five per cent. bonds, which will, it is understood, be offered at 102½ and interest. The $5,000,000 of stock will be listed on the Philadelphia Stock Exchange. The name of the new company has not been finally determined upon, but the "Baltimore Consolidated Electric Company" is proposed.

At the meeting of the stockholders of the Southern Electric Light & Power Company in Philadelphia on the 23d inst., the proposition of the directors to increase the capital stock of the company from $400,000 to $2,000,000 was ratified by a vote of 31,851 shares out of a total of 40,000. The Southern Electric Light & Power Company supplies all that portion of the city lying below South street from river to river, and the increase in capital was prompted by the additional plant and machinery necessary to fully supply the district covered by the company.

The Illinois State Railroad Commissioners in their annual report petition for special legislation which shall give them jurisdiction over all the street railroads, the sleeping car companies and telephone and telegraph companies operated in the State. The report also recommends that the Railroad Commissioners be given the discretionary power to pass upon the advisability of the construction of any new road, thereby preventing the speculator from playing upon the credulity of the public by placing upon the market bonds issued for the construction of a road which can never even pay its operating expenses.

Attorneys Watson and McCleave have filed in Common Pleas Court No. 3 at Pittsburg, Pa., proofs of service upon Murray A. Verner, H. Sellers McKee, Daniel Beech and D. J. Brickell of the bill in equity filed recently by the Pittsburg & Birmingham Traction Company to obtain an accounting of over $1,700,000. It is claimed that the company was defrauded of most of that sum. The court made an order giving each defendant twenty days after serving of notice of the filing of the bill to enter his appearance and file an answer. It was also directed that bill be served on Edward W. Clark, S. W. Colton, Jr., Edward W. Clark, Jr., J. Milton Colton, C. Howard Clark and C. Ford Stevens, wherever the persons named can be found.

General McNulta, receiver of the National Bank of Illinois and of the Calumet Electric Railway Company, has filed a report in the United States Circuit Court, Chicago, giving an itemized statement of the receipts and disbursements of the Calumet Railway Company between May 1, 1897, and August 31, 1898. The total receipts were $503,475, and the disbursements were $492,938 86. The receipts from operation sources were $281,786 39. The cost of operation and expenses were $297,-469. On the credit side was included an item of $195,000, representing the receiver's certificates issued by order of the court. The certificates were issued in order that the National Bank of Illinois might be reimbursed for money which it advanced to the railway company. These certificates bear 6 per cent. interest yearly and are payable on or before June 1, 1900.

James F. Rusling and a number of other holders of preferred stock in the Trenton (N. J.) Light & Power Company, which was recently sold to a syndicate headed by Colonel Kuser, have instructed Counsellors Beasley and Holt to institute suit against James Moses to compel him to pay over to the preferred stockholders of the company the sum of $100,000, the amount received by Mr. Moses for the 2,500 shares of common stock of the company which he sold to the syndicate. Mr. Rusling and some of the other holders of preferred stock claim that this stock was held in trust for them, while Mr. Moses and several of the stockholders contend that it was the personal property of Mr. Moses, awarded to him by the stockholders of the People's Electric Light Company for managing the deal by which that company was merged in the Trenton Light & Power Company.

Five hundred thousand dollars of the Westinghouse Electric & Manufacturing Company's new issue of $3,500,000 of 5 % gold coupon debentures were offered for sale last week by a Pittsburg bank at 102½ and interest. The following facts regarding the loan are given in the "Financial Chronicle": "Fifteen-year 5 per cent. gold coupon debentures, free of tax, issued by the Mercantile Trust Company of New York against the bond of the Westinghouse Electric & Manufacturing Company; total issue $3,500,000; denomination $1,000; interest payable January and July. Secured by total assets of the company, which on September 30, 1898, exclusive of patents, charters, franchises, good will, etc., aggregated $16,045,593. The debenture contract provides by ample agreement, and by proper instrument on record in the Recorder's office, that there shall be no lien placed on the company's present or future real estate or other assets that does not provide for these debentures. Commencing 1900, the company shall pay to the trustee, either in cash or by surrender of debentures, $150,000 yearly. For the purpose of the sinking fund, the company may draw debentures by lot, and the debentures so drawn shall be paid for at $1,050 each, with accrued interest."

ELECTRICITY.

Vol. XV. NEW YORK, DECEMBER 7, 1898. No. 22.

ELECTRICITY.

Published every Wednesday by the

ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.

Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES,	$2.50
IN CLUBS OF FIVE OR MORE,	2.00
FOREIGN COUNTRIES,	4.50
SINGLE COPIES,	10 cents

Remit by Express, Money Order, Draft, Post Office Order or Registered Letter.

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

THE TRADE SUPPLIED BY

THE AMERICAN NEWS COMPANY.

CONTENTS.

EDITORIAL NOTES.

The Telephone and Lighting Situation. It would certainly seem as though the near future would see some important developments in the telephone and electric lighting fields in New York City. But a short time ago everything pointed to a change in the control of the Consolidated Telegraph & Electrical Subway Company and of the Empire City Subway Company, which have for years been operated in common, the former leasing the latter. It is said to be the intention of the Consolidated Telegraph & Electrical Subway Company to retain control of the high tension conduits, while the Empire Company, which has been all along practically controlled by the New York Telephone Company, will continue to operate the low tension conduits. The separation of these two companies and the change in their control, following as it does the incorporation of the New York Gas & Electric Light, Heat & Power Company with its capital of $25,000,000, as well as the rumor that the Metropolitan Street Railway Company contemplates going into the electric lighting business, appears significant, to say the least, and leaves the question as to who the new owners of the subway companies will be in doubt. Possibly what is known as the People's Telephone Company, which was not long ago incorporated at Albany with a capital of $5,000,000, with the intention of fighting the existing company, and which is said to have the good-will of the present city administration, will have a hand in the matter. It is moreover thought that the two subway companies are still controlled by men influential in politics, but whose names will not be allowed to appear in connection with the management.

Another point worthy to be mentioned in this connection is the fact that another new telephone company was incorporated in Albany on November 24, which, from the ingenious manner in which the incorporation papers were drawn, has led many to believe that the undertaking will be a far more important one than would appear at first glance. Although the title filed is "The New Rochelle & Westchester Telephone Company," provision is made for covering the whole of New York, as well as several other States. One of the incorporators of the new undertaking is reported as having made the following statement as to the aims of the company:

"For the present the business of the company will be confined to a system between New Rochelle and Mamaroneck. In time we will put in exchanges and connect other cities, as provided for in our charter. We will not have any exchanges in New York City for the present, but we may later."

What with the secrecy which surrounds the plans of the several new lighting and telephone companies, and the manipulation of the existing subway properties, it will be surprising if the coming year does not bring forth some rather startling developments in those industries.

* * *

Expense Account of the Shoreditch Destructor Plant. Just at present what is known as the Shoreditch garbage destructor plant, situated in a vestry of London, appears to be attracting wide attention in England. As we have several times explained, a number of these plants were erected a year or two ago in various localities throughout Great Britain with a view to consuming the garbage collected in the vicinity, the steam obtained from this low grade fuel being utilized principally for generating electricity for lighting purposes. From a hygienic point of view the destruction by fire of the garbage of a community was highly to be recommended and was much preferable to placing it upon barges with a view to dumping it either at sea or upon barren ground as was formerly done with the refuse from the vestry of Shoreditch. As to whether any financial profit could be derived from a lighting plant run with refuse as a fuel is a question which has excited considerable interest during the past year, not only in Great Britain but in this country as well, for should the experiment prove successful on the other side of the Atlantic there is scarcely any doubt that destructor plants of this or a similar nature would be erected in many of the principal cities in the United States where the problem of garbage disposal has been worrying the authorities for years. On November 15 a report embodying a trading account of the Shoreditch destructor plant for its first year of operation was made public, and it is the figures given in this statement that are attracting so much attention.

Before giving these figures it might be well for our readers to get an idea of just what these plants consist. There is a destructor house, which usually contains a number of cells or small furnaces into which the refuse is dumped. A forced draft is generally employed to stimulate combustion, the obnoxious gases passing out of the front of each cell and through the boilers before effecting their escape to the atmosphere. As previously stated, the steam produced by this low-grade fuel is in most cases used to generate electricity for lighting purposes. Several serious difficulties had to be overcome in designing plants of this nature. In the first place the steady feeding of the refuse would generate a steady

amount of steam, whereas the demand for power would naturally be irregular, a far greater amount being required at night than during the day. Two methods of overcoming this difficulty were employed: storage batteries were made use of for storing the surplus current, and what is known as the Halpin thermal storage system was installed. Both of these systems are in use in the Shoreditch plant.

At Shoreditch a destructor cell is placed on either side of the boiler. The refuse is brought in by carts and dumped into a trolley car, which is then raised by an electric hoist, of which there are two, to a platform on top of the cells, from which it is run to the hoppers and emptied into the cell beneath. This arrangement necessitates the consumption of a portion of the electric power generated, for operating the hoists and other machinery.

Now to return to the report recently issued. This showed a sale of current, including public lighting, for the last fiscal year amounting to $41,270.52 at the rate of 7 cents per unit. The dust destructor in operating consumed $2,681.41 worth of current, which added to the amount of current sold and including other minor receipts would make $45,205.16 as the sum to be credited to the plant. On the other hand, the coal consumed, presumably in starting the fires, amounted to $2,163.93, which added to the engineer's salary and laborers' wages as well as to interest and amount set aside as a sinking fund, brings the total expenditure so far as the lighting part of the plant is concerned up to $29,282.68, which apparently leaves a net profit of $15,922.48. The refuse destructor account proper apparently shows a saving in the handling of the refuse of $6,266.27, and this added to the profit of the lighting plant makes $22,188.75, from which however a debit balance for steam used, amounting to $8,793.62, has to be deducted. This would therefore leave a net profit and saving of $13,395.13. Providing this is correct, it speaks well for destructor plants in general and the Shoreditch plant in particular. Unfortunately there seems to be considerable skepticism in England as to the correctness of the last figure, apparently owing to the manner in which the figures in the refuse destructor account were gotten at, and one gentleman has placed himself on record as stating that were everything taken into account it is doubtful if the profit would exceed $1,500 to $2,000. Some time ago, referring to the destructor plants in England, we stated that it was the opinion of a well-known American engineer who had made a special study of this method of refuse disposal that these destructors were not as efficient as was claimed, and the severe criticism of the above report by the technical press in England would seem to bear him out in his statement. However this may be, and allowing that a yearly profit of but $1,500 can be derived from an undertaking of this character, the fact that the garbage of a community is being disposed of in an unobjectionable manner and at no cost should still recommend garbage destructor plants for use in thickly populated communities, many of which are to-day disposing of their refuse at considerable expense.

* * *

Tit for Tat. The Manufacturers' Association of Canada has called the attention of the Anglo-American Commission, now holding a series of meetings in Washington, to the fact that the United States Immigration Bureau has recently made a number of rulings to the effect that the commercial travelers of Canada fall within the restrictions of the alien labor law, and that they cannot carry on their work on this side of the border.

In bringing the matter before the Commission the statement is made that a large number of commercial travelers from the United States have regular routes through Canada, and that if this country intends to exclude Canadian salesmen the Canadian Government will perforce retaliate by excluding American salesmen from Canada. Should this proceeding be carried out it will work great hardship to the manufacturers of electrical apparatus and appliances, many of whom have salesmen traversing Canada in every direction in quest of orders, and they will have to be recalled. Efforts will be made, however, to have the restrictions removed on both sides.

Under the Searchlight.

Notes and Comments on Various Topics.

ARRANGEMENTS have just been completed for a fire telephone service for New York City. Telephones are to be attached to every lamp-post holding a fire signal box, which arrangement will permit of a conversation being carried on between the point where the fire is located and headquarters. The district along Broadway will be the first equipped.

* * *

THE trolley car, which displaced the mule in street-railway work, is fast outrivaling that disappearing quadruped as a source of mirth in court proceedings. Only recently in Brooklyn a street car was introduced as a witness (?) in an important case and appeared bodily at the court-house door (being too ponderous to be put directly upon the stand), and was there subjected to an examination by the jury. It proved a convincing witness and won the case.

In a suit at Memphis, which is still going on we believe, a trolley car is the defendant. The suit was brought by a Mississippian on a temporary visit to the Tennessee city, who sought to recover $20,000 damages for such trifling injuries as a broken leg, two broken ribs and a section of his left ear cut off. The defense demurred to his prayer for damages on the ground that he was a stranger in the city and was intoxicated when the accident occurred, as early as 8:30 in the evening. On the stand, the plaintiff explained that he had, prior to the time the car struck him, drank but three glasses of beer and was on his way to visit a young lady. He did not know where she lived, but was standing in the middle of the street looking for her house when the car ran him down. As we have stated, this case is still unfinished, but it is questionable whether a Memphis jury will greatly blame a trolley car for knocking a man over who thought it necessary to fill himself up with beer before setting out to call upon one of their townswomen whose residence was unknown to him.

Another trolley suit that has a bit of humor in it is now on trial in our sister borough of Brooklyn. There is a lady in this case also—two in fact, for the complainant is of that sex. She deposes that she was run down last summer by a car of a Coney Island line on its way to that bewildering resort, and bases her demand for damages on the alleged negligence of the motorman, whom she accuses of carrying on a flirtation with a pretty Armenian girl who was on the platform beside him. The plaintiff, with something of scorn in her words, states that the motorman was so very attentive to the gazelle-eyed foreigner that he failed to put on the brakes in time to save her from a fractured limb. That suit is also still in progress, but a verdict of $1,500 has just been given in the case of a young lady in Newburg, whose claim for $25,000 damages was founded on circumstances that, in contrast to the above, are rather creditable to the car official, whose attentiveness to duty was the cause of the trouble. The claim was that while on the defendant's car the conductor at the request of a passenger pulled down the curtain. Afterwards it flew up and an iron at the bottom fell out and cut a gash in the plaintiff's scalp. It was claimed that she suffered from concussion of the brain, that her nerves were shattered and that her spine was injured, and that she would never recover.

These are the court incidents of a single week in which the subject of this notice is involved, and while they serve to show that the trolley car contributes more perhaps than it ought to to human suffering, it nevertheless makes some amends for its shortcomings by the penalties it has to pay and by adding constantly to the curiosities of literature.

* * *

THE Philadelphia Board of Health, says the *Record* of that city, is the recipient of many queer complaints, but the one it received the other day from a disgusted and nervously prostrated jeweller of Eighth street is entitled to prominence in a class by itself. It seems that the jewelry store is located next door to a phonograph establishment that has for the purpose of attracting passers-by a phonograph going all day long. All kinds of tunes and alleged witty sayings are squeaked forth from early in the morning until late at night in peculiarly penetrating and nerve-destroying tones. At first the machine efforts at wit amused the jeweller, and he used to laugh heartily at the comicalities, but these were repeated with such deadly persistency that they began to pall, and from being amused the tradesman grew into a negative desperado. One day the climax was reached when a customer, who looked like "ready money," came in to buy a diamond ring. For some reason the machine next door was quiet for a while, and the jeweller was just on the point of closing a highly profitable sale when the shrill voice of the phonograph began to sing "Get Your Money's Worth." The amazed customer hesitated, and finally told the jeweller he would call another day. This incident was the last straw, and the Board of Health will now look into the matter.

* * *

THE New York Association of California Pioneers held its annual dinner on the afternoon of December 1. Some twenty-five of these hardy adventurers, who fought their way over the plains or across the Isthmus in '48 and '49, to open up one of the most productive States in the Union, sat down to partake of a repast which was in striking contrast to the salt pork and hard tack they had to content themselves with fifty years before. Many stories of the early days were told and reminiscences indulged in, and needless to say the graybeards enjoyed themselves to the limit.

* * *

RESIDENTS of upper Madison avenue, New York, were treated to a magnificent display of electric fire at 7 o'clock on the stormy evening of December 3. The entire neighborhood and the hill at 135th street were illuminated as if by a great blaze. When the fire shot from the slot of the electric line, between 94th and 95th streets, two cars were close together on the north bound track, while one was about even with them on the south bound track. Passengers in the cars were panic stricken and fled in terror to the streets. Other cars stopped a few feet from the electric disturbance, and their passengers fled to the street and joined the crowd, which watched the efforts of the workmen who rattled up in a repair wagon. Burning out of a fuse under a north bound car is said to have caused the terrifying display.

* * *

A REPORT comes from Baltimore that a concern of that city has bought out the steam tram road at San Juan, Porto Rico, and is planning to convert the line into a modern electric railroad. J. G. White & Co. is the Baltimore concern which engineered the deal. It is contemplated by the owners of the property to not only reconstruct the road for operation by electricity, but also to build a power station that will furnish electric lights.

ELECTRIC FOUNTAINS.*

Their Construction and Operation—Mechanism of the Color Screens and Water Valves—Examples of the Displays.

BY L. S. LEVY.

With the introduction of electrical displays on the stage, not many years ago, there opened a new era for electrical development, and we have to-day many electric appliances designed solely for producing spectacular effect. One of the most ingenious of these—the electric fountain—has gone through so rapid a series of improvements that it is now the principal attraction at illuminated displays, and a source of wonder and enjoyment to admiring thousands.

To the charm of the fountain's display by day, is added at night an aspect so weird and of such exquisite beauty as to suggest to the uninitiated the agency of the supernatural.

The illustration on this page is one of an electric fountain situated at the main entrance to Prospect Park, Brooklyn. This fountain represents in its particular line the highest development of electrical spectacular effects.

The view shown in Fig 1 is illustrative of a group of beehives with vari-colored shafts of water. The tall shaft at the center has been properly termed a "geyser," and is indeed representative of that beautiful manifestation of nature, with the added beauty that the electric light only can impart.

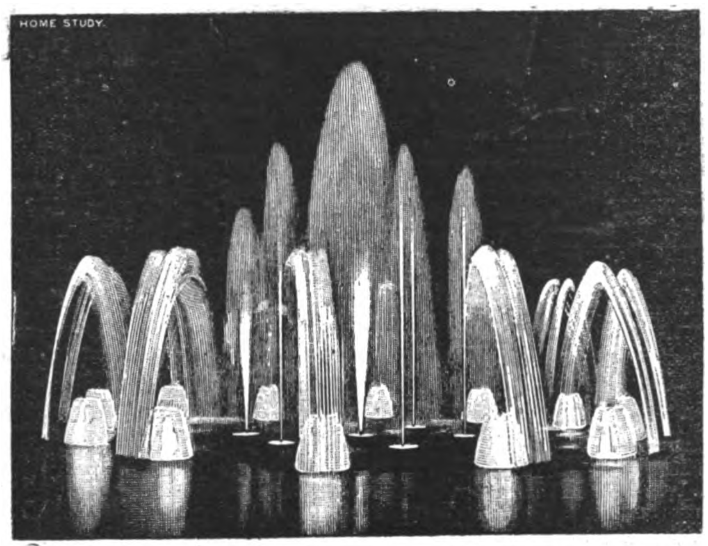

FIG. 1.

The successful combination of a colored beam of light with a directed stream or spray of water whose hues are changed at will is easily arranged. The principle underlying this combination is illustrated in Fig. 2. This sketch shows one method employed for illuminating the stream in an electric fountain. A transparent window g is placed immediately opposite the opening in the fountain nozzle n, and the rays from an arc lamp of special design are projected through the window and into the path of the jet j. A portion of the rays is reflected from the surface of the stream, producing an illumination of the falling drops. A quite different method of securing a diffusion of the rays through the stream was adopted in the design of the Brooklyn fountain.

It is evident that an arc lamp of smaller candle power will be required to illuminate the stream if the rays are thrown directly upon the surface of the stream as it emerges from the nozzle. It possibly provided, in this instance, the only solution to the problem of illumination, as the display is not limited to that produced by solid streams.

The fountain, as shown, is located in the center of a large oval grass plot. The circular base has a concrete foundation and a cement bottom, and has a diameter of about 120 feet. The actual diameter of the fountain proper—that part including the jets—is about 40 feet. Around the inner edge of the cement coping are arranged, at regular intervals, about eighty-eight 25 candle power incandescent lamps, each enclosed in a waterproof globe. They are used for illumination at night when no display is in progress.

The fountain proper, in any case, consists of jets and the illuminating funnels through the colored rays are projected.

Directly beneath the Brooklyn fountain is a large room, in which are installed the lamps, color-screen apparatus, and valves for the control of the water supply. A view of the interior of this room is shown in Fig. 3. In the ceiling immediately above the lamp l is shown the lower end of the aperture, or funnel, through which the light from the lamp is projected. This funnel extends a short distance above the surface of the water in the basin, as can be seen by referring to the illustration of the "Wheat Sheaves," Fig. 6. Surrounding the upper end of each of the funnels (there are nineteen) is a circular pipe, pierced by a number of holes through which the water is projected to form the various combinations of light and color. Protruding from the center of each funnel is a pipe of about 1¼ inches diameter, which assists in the production of the "Fan," Fig. 5, and other pleasing effects.

Below each of the funnels a powerful arc lamp is placed. This lamp is of the focusing-projection pattern, and is provided with a parabolic reflector, in order to direct the rays in parallel lines. The lamp requires for its operation a current of 40 amperes, maintained by an E.M.F. of 50 volts.

The lamp, used as it stands, can only impart a white illumination of intense brightness to the stream. For the purposes of color variation color disks are provided, which are mounted so that they can be brought into the path of the light rays. This detail of construction has been very ingeniously devised, as will be evident from Fig. 3. The screens, bearing diaphragms aa of various colors, are pivoted about a common center b, and when swung through an angle of nearly 90° are directly beneath the funnel, intercepting and lending color to the rays from the lamp l. There is one opaque screen provided for the purpose of darkening the funnel if at any time during a display it is necessary to effect a combination in which all the funnels are not used.

It is evident that, to make the operation of the fountain as simple as possible, the apparatus by which the hydraulic mechanism is operated and the electric lights controlled must be managed by as few persons as is consistent with good results.

Several very ingenious appliances, which almost assume the proportions of independent systems, have been introduced in the installation of the fountain under description. The successful operation of the color screens, in conjunction with the various combinations, determines in a measure the value and efficiency of the fountain.

It will be gathered from what has been said that a system which provides for a concentration of the controlling mechanism has been adopted in connection with the fountain illustrated in this article.

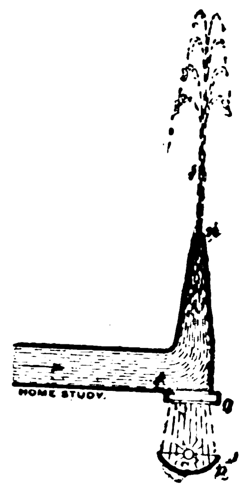

FIG. 2.

The principal part of the system lies in the mechanism that operates the color screen directly, and this, in the case at hand, is made up of a number of cylinders the pistons of which are connected to the arms of the color screens and are operated by compressed air derived from a special compressor, electrically driven.

The control of the air cylinders, illustrated at c, Fig. 3, is effected by means of valves controlled by push buttons. It is evident that, to effect the various combinations, numerous buttons, systematically arranged, must be provided and installed in the most convenient position. The manner of their arrangement can be seen by referring to Fig. 4. Here the buttons constitute a switchboard of no mean proportions and complexity.

As there are eight color screens to each funnel, a separate cable, composed of sixteen No. 24 B. & S. wires, runs from each set of valves to a set of buttons placed on the color board, over the hydraulic valves in the operating room, as shown in Fig. 4. A common return wire is used for all the magnets. Each of these compound buttons consists of sixteen separate pushes in two rows, each button of the top

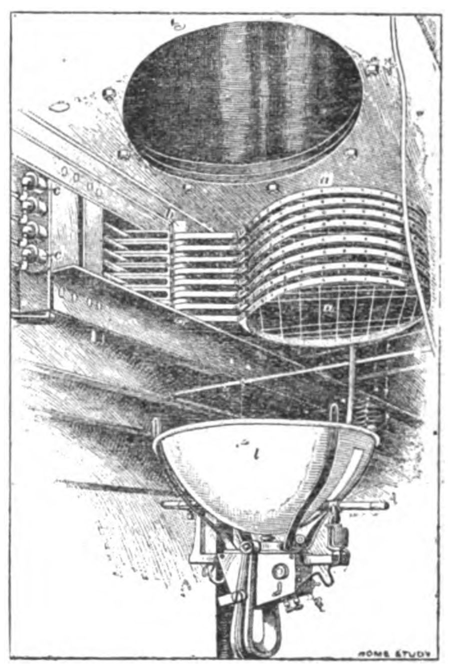

FIG. 3.

* From the *Home Study Magazine*, Scranton, Pa.

row being colored and corresponding with its respective color disk, which is operated when the button is pushed.

In the lower row, the buttons are all white, and each acts as a release button for the colored button below which it is located. An ordinary open-circuit battery is used to operate these electro-pneumatic valves. When the release button is pushed, the air cylinder is exhausted by reason of its connection with the atmosphere, and the disk is automatically

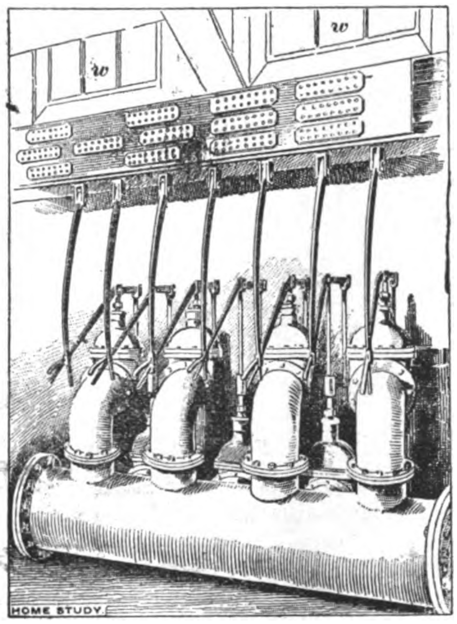

FIG. 4.

returned to its normal position by means of a barrel spring. The carrying levers of each of the color disks are mounted on ball bearings, thus greatly facilitating their operation.

At *w*, *w*, Fig. 4, will be seen two windows, which are located in the side wall of the fountain basin, keeping the fountain in sight of the operator at all times. This arrangement is an appreciable factor in the speed with which the fountain can be operated, as no dependence is placed on the transmission

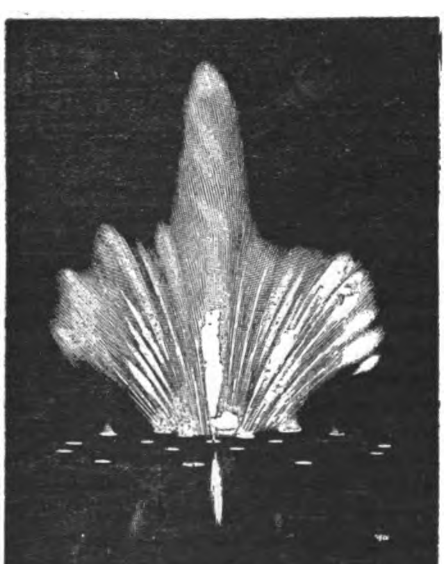

FIG. 5.

of instructions; so that it is free from the mistakes which are bound to occur in the best regulated systems wherein the operator cannot see the fountain.

The concentration of the entire operating mechanism at one point has made it possible to operate the fountain with only two men—one being located on a platform in front of the valves and color buttons, and the other having charge of the lamps beneath the basin. The man at the controlling appliances simply raises the levers to effect any suitable water display, after having pushed the necessary color buttons for the different funnels.

This change of views can be made so rapidly that the fountains may be used for displays of a particular character. For instance, the effect produced in the display pictured at Fig. 5, while in itself a beautiful combination and of magnificent appearance at night, when colored, would be enhanced if the design were some such favorite theme as that of our national emblem.

In excellent keeping with so grand a sight, the

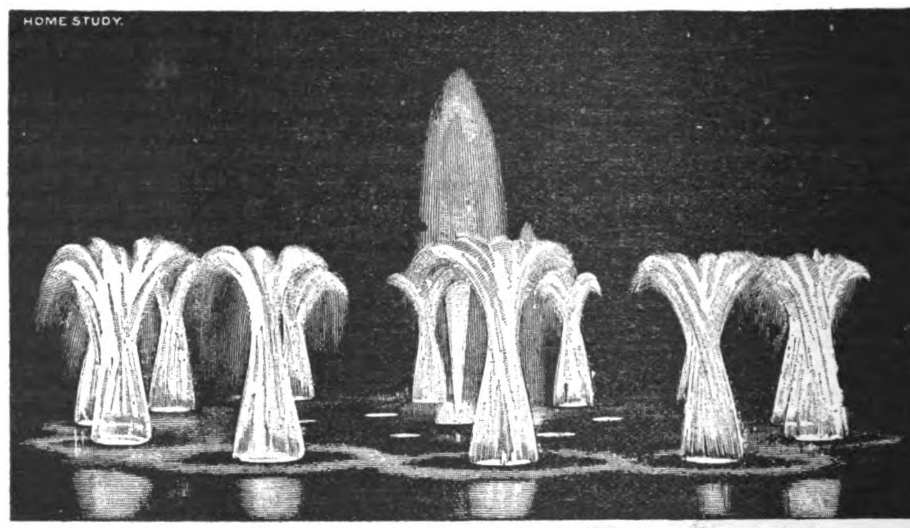

FIG. 6.

change to that in Fig. 6 could be rapidly effected, and a representation given of the prime product of our great West, illuminated in its truly beautiful color—emblematic of national integrity and of the vast resources of the Republic.

THE ELECTRIC MOTO-VEHICLE.*

BY C. E. WOODS.

(*Concluded from page 328.*)

I remember in my first early experience the disappointments which arose in regard to weights, constructional features, controls, etc., and three years ago I thought it would never be possible to build a moto-vehicle with any mileage capacity at all at a less weight than 1,800 or 2,000 lbs., yet to-day I have vehicles in operation which weigh 800 lbs., including everything, and have a mileage capacity of about twenty-eight miles on one charge of the batteries. My work has also developed the fact that as great a range in different vehicles can be obtained as regards size, usefulness, etc., as in any of the prior lines of vehicles, and I have found that for a diversity of design covering nearly thirty different styles of vehicles the whole proposition is confined to what I call four different sizes of equipments; by this I mean four different sizes of motors, batteries, and et ceteras, which are as follows:

My lightest vehicle is equipped with one 2½ HP. motor, 36 batteries of 16 ampere hour capacity for two hours, which run the vehicle at a speed of fourteen miles per hour carrying two people. The weights in all the construction work of this vehicle have been reduced to a minimum, the total weight of the batteries being 440 lbs., about 360 lbs. being in the motor and vehicle proper. To tabulate these different equipments will be the most concise way of putting them, and I will call my first equipment No. ½: passenger capacity, two; complete weight of vehicle, 800 lbs.; weight of batteries, 440 lbs.; average miles run on one battery charge, 20; speed (miles per hour), first 3½, second 7, third 14; number of motors used on vehicle, 1; HP. of same, 2½; number of battery cells, 36; amperes per hour for three hours, 12; time in hours required to charge batteries, 3.

* Read before the Chicago Electrical Association, Nov. 18, 1898.

No. 1 equipment, designed for a top carriage or a heavy buggy: Complete weight of vehicle, 1,150 lbs.; weight of batteries, 600 lbs.; average miles run on one charge, 25; speed (miles per hour), first 3½, second 7, third 14; number of motors used on vehicle, 2; HP. of same, 3; number of battery cells, 40; amperes per hour for three hours, 18; time in hours required to charge batteries, 3.

No. 2 equipment, which is designed for four passengers in an open vehicle such as a trap or break: Complete weight of vehicle, 1,800 lbs.; weight of battery, 800 lbs.; average miles run on one battery charge, 30; speed (miles per hour), first 3½, second 7, third 14; number of motors used on vehicle, 2; HP. of same, 5; number of battery cells, 40; amperes per hour for three hours, 30; time in hours required to charge batteries, 3.

No. 3 equipment, which is designed for both commercial delivery wagons and for my heavy cabs, of which I have built quite a number; also applied to heavy carriages with tops; has a passenger capacity for from four to eight people: Complete weight of vehicle, 2,400 lbs.; weight of batteries, 1,000 lbs.; average miles run on one charge, 25; speed (miles per hour), first 3, second 6, third 12; number of motors used on vehicle, 2; HP. of same, 6½; number of battery cells, 40; time in hours required to charge batteries, 3.

All of these various sizes of equipments have been built by me and applied to different vehicles, and I regret that time before rendering this paper did not allow me to get a condensed compilation of the tests, but I will give one of the large cabs which will have to stand as a criterion for the rest.

The original calculation for the cab read as follows:

Maximum speed of vehicle, miles per hour, 12.

Total load to be carried, including four persons 3,200 lbs.

Maximum HP. required in motors, 5½.

Average HP. required in motors, 4.

Voltage of motors, 72.

Volts lost in transmission in motor, 8.

Maximum voltage required, 80.

Number of cells required at two volts each, 40.

Maximum amperes required, 52.

Maximum amperes per motor, 26.

Average amperes per motor, 22.

Mileage capacity desired at maximum speed, 30.

Hours' discharge required, 2½.

Ampere hour capacity required in battery, 2½ hours; discharge, 110.

Greatest maximum effort required for overcoming inertia and grade climbing, 9.

In accordance with these calculations, from prior experience in smaller vehicles I designed two motors of a nominal 3½ HP. each, either one of which was capable of running the vehicle at a slight overload

under normal conditions of level roadway. The tests of the cabs showed on a macadam and asphalt road a very little difference and called, at a speed of 12 miles per hour, for 42 amperes with a potential of 72 volts at the motor terminals, which amounts to practically 4 HP. In overcoming inertia the amperes would rise with a slight drop of voltage to 65, gradually diminishing until a speed of twelve miles per hour was reached, which acceleration consumes a period of about half a minute.

On these cabs a special instrument, combining both a voltmeter and an ammeter in one case, is used, and I am keeping daily record of their performances under all conditions of roadway and weather, and I find these vehicles wholly adequate to all the conditions to which street traffic is ordinarily subjected.

There has been a great deal of controversy concerning the excessive weight of moto-vehicles and also considerable controversy by some of our theorists about what is considered dead and pay weight, and I want to say here that this limitation has not as yet been reached in my experience. We are perforce obliged to have weight for traction purposes, and many tests made by me on slippery roads, bad places, etc., have proved that with power applied to but two driving wheels we could not reduce our weight more than about 15 to 18 per cent. of what I have already obtained without making it too light for good traction under all conditions of road.

I have also found a very great difference in amount of power consumed in the use of rubber tires. I recently tried a new tire on the above named cab which consumed about 18 per cent. more power than the ones I am regularly using. I also, by very careful tests, have discovered that the hard rubber tire is far preferable to the pneumatic tire for use on moto-vehicles—and this without any reference to its first cost, durability or freedom from punctures. The facts of the case are that the pneumatic tire absorbs more energy by about 20 per cent. when inflated and by a very considerable increase when it becomes deflated to different points of pressure. My first attention was called to this by some tests made by Mr. Kimball of the C. P. Kimball Carriage Company, and I afterwards substantiated these tests myself in another direction, after which I have confined all my designs to the use of wood wheels and hard rubber tires.

The point of control has been a matter of considerable discussion by both those directly and indirectly interested in the development of the moto-vehicle. I have tried series paralleling the fields and I have also tried series paralleling the batteries, after which I have adopted exclusively the series paralleling of the batteries as my method of installation. The one thing to be observed is to have very large contacts and connections and to take the same pains in the distribution of the batteries when in parallel as one does in the distribution of current in the armature. In other words, a uniform resistance of the circuits of the different batteries will produce perfectly satisfactory results in their operation, which I do not find to be the case in series paralleling the fields. This latter can be done to such an extent that but a small rise of current would be made in overcoming inertia, but the excessive amount of field winding will over-saturate the fields unless they are unnecessarily large, and tends to a very considerable loss of voltage in dead resistance, and while we economize in current we do not economize in energy as in the case of series paralleling the batteries.

Three speeds I have found to be sufficient for all practical purposes even on our congested streets, and now have my motors running in parallel entirely independent from one another in their propelling function. Fourteen miles per hour for the larger vehicles I have found to be about the practical limit, as the amount of momentum stored up in the given weights of the vehicles cannot be brought under control by brake application quick enough to be safe on our city streets at greater speeds. In other words, we cannot brake on the moto-vehicle any more than we can on the car beyond the locking of the wheels. In the light road buggy which I have, I have geared it up to 20 miles an hour and find that with 800 lbs. I can handle it with a reasonable degree of safety on boulevards and parks, but I do not recommend these speeds to go any higher as a general proposition, although as a racing proposition I believe that the moto-vehicle will be brought down to 1½ minutes for a mile, or perhaps even less.

I regret very much that time will not permit me to go into the question of storage batteries for moto-vehicles, but as this has been a line of development confined entirely within itself for use on the vehicle rather than in the vehicle proper, I have not undertaken its diagnosis in this paper. I will say, however, that there are three different batteries on the market now which seem to be fulfilling the requirements, and as a comparison I will take the cab battery.

One make weighs 1,120 lbs. and a 36 ampere discharge for three hours; one weighs 1,500 lbs. for a 37½ ampere discharge for 3½ hours; and one weighs 1,000 lbs. for a 36 ampere discharge for three hours. The ratios of capacities and weights are the same for all other sizes.

I sincerely hope that those directly interested in the development of the storage battery for this purpose will in the near future deliver to us some information regarding difficulties they have had to overcome. I am frank to say that my experience up to date with the storage battery has more than met my expectations alike in capacity, weight and durability, and with such improvements as may be made from this time on there need be no further anxiety regarding the success of the storage battery in such work. I have tried these vehicles under every condition of road and work that the vehicles can be put to, and my troubles with the storage battery have been far less under intelligent care and treatment than the public generally credits it with.

I noticed recently in one of our leading journals an editorial which stated that the hardest problem is the storage battery, which will "sputter, fume, give out on the road, leak, disintegrate, corrode, short circuit," and so on, and I think that the gentleman who edited this article must have taken very little pains to inform himself as to the general status of the storage battery as it is being used to-day in the moto-vehicle. It would be just as consistent for him to say that electric power and light plants were impracticable because boilers would burst, engines break down, armatures burn out, street construction blow down, etc., etc., all of which we know are possibilities but are not probabilities under the advanced stage of the art.

From all this it would seem that there has been just as much engineering work in the development of the moto-vehicle down to the present day as there has been in many other propositions, and it is with great pleasure that I find many of the engineers in other directions so interested in the proposition, notwithstanding the fact that but few of them have considered it solely from an engineering point of view. It promises to be a great industry and ultimately will throw large professional work toward other engineers than those directly interested in its manufacture; and it will always be a personal pleasure to me to give such practical illustration and information as lies within my power to my fellow-craft.

An Electrically Operated Factory.

It is stated that a new hardwood flooring factory, now in course of construction at Cadillac, Mich., will possess the unique character of being destitute of shafting and of having but one driving belt—that one driving the dynamos. There will be eight flooring machines, boring machines, end matchers, and other tools necessary in such a factory, each machine having an independent electric motor.

THE NEW ELECTRIC CRANES AT SOUTHAMPTON HARBOR.*

The completion and official trial, last week, of the new electric cranes erected by the Southampton Harbor Board, and their impending taking-over from the contractors, Messrs. Stothert and Pitt, of Bath, render opportune a description of these interesting machines and some account of the reasons which have led to their erection. We may say at the outset that, through the courtesy of Mr. J. G. W. Aldridge, the electrical engineer to the Southampton Harbor Board, we have recently had an opportunity of inspecting these cranes and of seeing them in operation.

In 1892, owing to the close competition between the harbor and the docks at Southampton, a committee of the Harbor Board was formed which, together with Mr. Aldridge and Mr. W. Bowyer, the energetic traffic manager, visited several Continental ports, with a view to discover the best means of expeditiously and cheaply handling cargoes by harbor cranes. Mr. Aldridge presented a report recommending the use of electric power, with the result that in 1893 the two 3-ton electric cranes described at that time in *The Electrician* were erected by Messrs. Statter & Co. So convinced did Mr. Bowyer quickly become as to the superiority in every respect of electrically-driven over every other kind of crane that he recommended an extension of the number of these cranes, and in 1896 specifications were drawn up by Mr. Aldridge and issued to contractors. A tender was accepted for three 3-ton cranes and one combined 12-ton and 3-ton crane, the complete equipment being carried out for £7,288.

While the new cranes somewhat resemble in general appearance the older pair erected on another quay, they differ in many respects from these as regards essential points of detail. One of the most interesting of the new departures is the arrangement for automatically ringing an electric bell in the cabin when the crane is set to hoist too great a load. The sheave at the end of the jib, instead of being carried in a rigid bearing, has its bearings supported in guides on a steel coil spring. Excessive load compresses this spring sufficiently to close an electric circuit and ring a bell in the cabin. Another interesting feature attaches to the combined crane, the provision for which arose out of the necessity to have a 12-ton crane as a stand-by, although it would be infrequently used as such. Mr. Aldridge wisely decided not to have a separate stand-by crane, but to combine the 12-ton hoisting gear with a 3-ton crane; and this he has done by an ingenious arrangement of gears, whereby the motors are made to operate at will either the smaller or the greater hoist, the slewing gear being the same in both cases. Change from one hoist to another can be effected in 55 sec., and is quite a simple matter.

The 3-ton cranes are constructed to lift 30 cwt. at 200 ft. per minute on a single rope, and three tons on a double rope at a proportionately lower speed. The radius of the cranes is 30 ft. and the normal slewing speed 400 ft. per minute with a 30 cwt. load. Two separate electric motors operate the hoisting and slewing motions, the hoisting motor being rated at 50 HP., and running at 600 revolutions per minute, and the slewing motor being rated at 10 HP. The lifting motors of the 3-ton crane are not reversible, and have copper brushes on the commutators; the lifting motors for the 12-ton have carbon brushes, being reversible. The slewing motors are all provided with carbon brushes. All the motors are of the two-pole drum-wound shunt-field type; they are supplied with current at 200 volts from the Corporation supply station. The pole-pieces are hinged to facilitate inspection. On the motor spindle is carried a Delta metal triple worm, gearing into a cut steel helical gear, the gear running in an en-

* From the *Electrician*, London.

closed oil bath. The gear wheel of the lift motor in the 3-ton cranes carries the main drum, but in the 12-ton crane it actuates a throw-out back gear, similar to that employed in lathes, by which the interchange is effected. The back gear actuates either the 3-ton or the 12-ton hoist, the other hoist being locked.

The lever for working the hoisting motor, and the wheel for operating the slewing motor, in each case actuates automatically the regulating resistance of the motor fields. As the lever passes over it pushes a number of plugs resembling cornet pistons, these being thrown in seriatim, and each plug short circuits part of the resistance by a carbon contact. We believe this method was first adopted by Messrs. Siemens & Halske, of Berlin, by whom the regulators were supplied for these crane motors.

Each crane cabin is provided with a convenient switchboard, carrying the electric switches and Evershed indicating instruments. The field and armature switches are interlocked. In each cabin there are two 32 CP. "Ediswan" glow lamps, also plugs for portable lamps, and near the top of the jib there is a group of glow lamps arranged in a reflector.

The manner in which current is led into the revolving cabin is of interest. In the center of the floor there is an insulated box containing a brass ring rigidly fixed to the floor. Inside this ring, and pressing against the inner surface of the ring, there is a copper brush of peculiar shape, rigidly connected to the stationary frame of the crane. This brush carries the current into the crane equally well whether the cabin be stationary or moving in either direction. Current is brought to the crane through flexible diatrine cables. One end of the cable is attached to the crane; the other can be attached to any one of the connecting boxes along the quay. From the power station to the quay boxes the current is carried in bare copper strip laid in wooden troughs. The consumption of power is found to be from 3½ to 5 units per hour, and the present price charged is 3d. per unit, but it is expected that the price will shortly be reduced.

Even at the comparatively high price charged for current there is no doubt about the superiority of electric cranes for handling cargoes cheaply and quickly. Much more work can be got out of the cranes when in commission; they are less liable to get out of commission through breakdown, and are much more quickly repaired when breakdown occurs; and the cost of repairs is so trifling that at Southampton no separate account is kept of them. There is a great saving also in standing charges, since the same generating plant can be used—as it is at Southampton—for lighting the harbor and the town.

It is sometimes stated by parties interested in rival kinds of cranes that electric cranes require specially skilled operators and cannot be placed in the hands of ordinary crane-men. This mythical notion has been completely exploded at Southampton. Not only have men quite unskilled in electrical machinery been put in charge of the cranes, but they have acquitted themselves even better than the one or two men who possessed some knowledge of electric motors and their appurtenances. Curiously enough, the best craneman at Southampton—the man who "can make the cranes speak," who can get more out of them than anyone else—is a workman quite ignorant of electrical machinery; yet he has never had a breakdown; on the other hand, an electrical man who for some time had charge of the cranes was frequently responsible for interruptions. Facts like these speak for themselves.

A Large Scotch Water Power Scheme.

An effort is being made in England to get the necessary rights and privileges for the carrying out of an extensive water power utilization scheme in the north of Scotland. It is proposed to erect a generating station near Loch Leven and utilize water power derived from the neighboring river and lochs as far as Loch Ericht. Dams are to be constructed to divert the waters of the Allt Glas into Loch Ericht, and for the purpose of raising the waters of Loch Ericht, by damming the river Ericht where it flows out of the south end of the lake so as to submerge the neighboring land. An aqueduct will be built as a communication with the two streams, Allt Coire a' Guibhais and Allt Dubh Garbh, and the waters of these streams will also be impounded.

POWER GAS FOR TRAMWAYS.

Steadily, if somewhat slowly, says the London *Electrical Review*, the idea of gas power advances and takes deeper hold, and in support of this view gives an abstract of an article in *Le Genie Civil* describing the electric tramways at Lausanne, which are notable as being dependent for their motive power upon a gas plant.

Coal is so dear a fuel in Switzerland, that the country's large store of water-powers has been much drawn upon for power purposes, and the use of electricity has become quite common. In England we have no water-power, and such cheap gas that much of the impetus present in other countries is absent. At Lausanne presumably water-power was not available, at least for the particular purposes of the tramways, and the choice lay between steam and gas, and was solved in favor of producer gas, though several steam engine builders offered to guarantee a steam expenditure of not over 22 lbs. per effective HP.-hour, or 2.48 lbs. of coal with an evaporation factor of 8. Gas power plant builders, however, offered power for 1.137 lbs. of coal per HP.-hour, and the plant has worked two years. It includes three Crossley engines of 130-HP. each, and three revolving bottom Taylor generators worked by superheated steam blast and air, the result being a mixture of part water gas and part power gas of higher calorific power than ordinary producer gas. It is cooled, scrubbed, and purified, and passes to the engine via a holder. The clinker is removed by revolving the generator bottom once a day. The engines have each two opposed cylinders on one crank, and this gives steadiness with a 6-ton fly-wheel. The jacket water is circulated and sprayed and used over and over again. It seems strange so near Lake Geneva to find water scarce.

The generators are of the Thury type, feeding a 300-element battery of 700 ampere-hours capacity. This serves to equalize the load. The line is eight miles in length and less than one mile is on a level. The maximum grade is 11.3 per cent., and is operated by adhesion alone. The cars seat 32 passengers and have each two Thury motors of 20 HP. The overhead system is employed, and cars have an independent electric brake as well as a hand brake.

During the first half of 1898 the fuel consumption was 850,000 lbs., the output 413,849, or equal to 2.05 lbs. of fuel per kilowatt. The fuel includes all fuel burned, even that for finding distilled water for accumulators. With steam engines the fuel expenditure per KW. would be 3.78 lbs., so that by the use of gas there has been effected an economy of $4,000 annually. This installation is but another proof of the economy to be derived from the use of producer gas. Undoubtedly the gas engine has been helped by the fact that illuminating gas has been so ubiquitous, but at the same time it has also been retarded by the great comparative unit cost of such gas, and the ideal gas has not been understood. Producer gas need not necessarily require a steam boiler to work its plant as at Lausanne. Equally good results are obtainable with gas plant operated by fan blast, any water being added from the wet bottom or hearth or by spray into the blast pipe. The object in view when a manufacturer or mill owner puts down gas plant is not to have gas plant plus a steam boiler but gas plant simply, which shall enable him to abolish the boiler altogether. Where this has been done we know that the question of fuel expense has lost much of its previous seriousness to the power user.

A FRENCH VIEW OF AMERICAN ELECTRIC TRACTION.

With a view to the adoption of electrical methods on the line now constructing between the old Orleans station and the new terminus, says the *Electrical Review*, London, the Orleans Railway Company sent to America on a voyage of study a group of engineers, Messieurs Solacroup, Sabouret, Valton, De Fremინville and Hiberty.

Their notes are published in the *Revue General des Chemins de Fer*, and are of the customary excellent quality which distinguishes the work of French engineers. *L'Industrie Electrique* gives extracts from which we have endeavored to cull. Our contemporary is brilliantly sarcastic at the expense of the Heilmann locomotive.

"While we are losing our time on the Heilmann locomotive, the Americans are utilizing, with success, experience gained in exploiting electrical tramways in the development of electrical traction on main line railways—*leaving the generating station at home.*"

The sting of this, as of many other things, comes in the tail. The Heilmann locomotive, as we all know, does not leave its generating station at home; but—snail like—bears it on its back a constant load and incumbrance. Here we have a genuine French opinion of the wisdom of it.

In ten years electrical traction has almost entirely supplanted horse traction and cable lines in America. New lines have been established at the same time as electric lighting in small towns, in the suburbs of large towns, reaching out to distances impracticable for either horse or cable roads; uniting the principal localities at 40 to 50 kilometers apart, and endeavoring by the junction of suburban network to raise up traffic between neighboring towns. By the current year 20,000 kilometers had been constructed, and bid fair to grow still faster in the immediate future. And London is thinking of experimenting!

From tramway work main line work has been taken up simply by carrying out everything on a little larger scale. Though so new on main line work—scarcely three years—electric traction has already been applied, so far as the deputation were aware, to the tunnel of the Baltimore & Ohio, to certain branches and sidings at Hoboken, New Haven and Whitingsville, the Boston and Nantasket Beach, Hartford and Berlin, Berlin and New Britain, the Lake Street and the West Side Elevated of Chicago, Washington and Mount Vernon, Burlington and Mount Holly, Norfolk and Ocean View, and on a little branch line of 5 kilometers in California.

We have repeated the list for the benefit of the London Metropolitan Railway, whose directors incompetently shiver between wind and water, afraid to venture, in their ignorance on the one hand, and fearful of rendering passengers too comfortable on the other hand.

The circumstances which compelled the adoption of electric locomotives in the Baltimore tunnel, in order to enable the company to compete for the New York traffic, are too well known to require any repetition from the French. The deputation observe that the service rendered is complete and regular. Electric locomotives alone haul freight trains also through the tunnel, and they note that all engineers, without exception, are satisfied. The third rail as a conductor has their approval rather than the overhead conductor, in that weight for weight copper has only from five to nine times the conducting power of steel, but it costs 1.05 franc per kilo, whereas steel rails (old) only cost 65 francs per ton (1,000 kilos). For other reasons, also, they approve the third rail. It appears to them a little out of the way to employ locomotives of 87 tons for a daily service of 15 trains when twice the number of trains might be worked with engines of half the weight; 22 tons per axle seems heavy. The engineers of the line consider, however, that the splitting up and re-

forming of trains would be worse than the inconveniences named. They would also have preferred a simple reduction motor in preference to direct connection for such slow speeds as are employed, and an increase in the number of axles. By this change the motors could run so much faster and be correspondingly less.

But, on the whole, great satisfaction is expressed, especially in view of this being the first application to main line work and that the service rendered is double—freight and passenger—the four motors being coupled in series for heavy loads, while for passenger trains the working is in parallel of other locomotives since made by the General Electric Company, that of the manufacturers' line at New Haven weighs 25.4 tons and has two motors, one on each four-wheeled truck, driving one axle direct at 500 volts. At Hoboken a 25.8-ton engine has a geared motor to each of its four axles. This is highly commended.

With a total weight of train of 239 tons on a run of 1.76 kilometers in 3 minutes 17 seconds, the total energy consumed was 14.5 KW. hours, or 34.4 watt hours per ton kilometer.

The cost of production is .0404 franc per KW. hour. Adding 10 per cent. for line loss, gives .044 franc (say .44d.). The electrical cost per 100 tons per kilometer is thus 1.54 franc, or practically 1½d., equal to 22 kilos. of coal. This includes all works' costs.

On the Berlin-Hartford line about 20 per cent. of the motors are off duty, which is declared small for machines doing their 570 kilometers per day. On the Nantasket Beach line, with 60-ton trains at 60 kilometers speed, the consumption of electricity varies from 37.3 to 50.8 watt-hours per ton kilometer. This is higher than at Baltimore, especially when it is considered that the line is nearly level, and at Baltimore the grade is considerable, but at Nantasket there are many stops—14 in 17 kilometers.

On the West Metropolitan of Chicago trains run at two minutes' headway. The motor cars weigh 26 tons, and draw during the daytime three trailer cars. The motor cars have two 125 HP. motors, one on each axle of one of the bogies. The journey speed is 24 kilometers per hour at a cost of 77 watt-hours per ton kilometer. The motor cars are overhauled every 40,000 kilometers, or about every four months. This occupies three days; 6 per cent. are under repairs. The chief overhauling is that of the armature. Stations only average 600 meters apart.

The necessity of attracting passengers by high speed has led to the construction of new motor cars with four motors of 150 HP. in place of two of 125 HP.—with a view, also, to hauling four trailers.

Full appreciation is awarded to the Sprague system of all motor car trains with synchronous working, whereby Mr. Sprague hopes to get up a velocity of 64 kilos per hour in 20 seconds, run at a speed of 90 kilometers, and employ 20 seconds in a brake stop, so securing on runs of only 500 to 600 meters a journey speed of 35 kilos per hour. Such is the order of ideas of American engineers. The French engineers see no further difficulty ahead; overhead or below, the conductor is equally practical, and a third rail on blocks of paraffined wood is fully shown at Chicago to deal perfectly with trains of 108 tons on 2 minutes' headway. General forms have already been established, and all apparatus has been brought to a size beyond what is required for the heaviest trains in France.

No more can the electric locomotive be looked upon as experimental. Daily work over many months has demonstrated its superior tractive power over steam, and its reduced weight for equal power. Improvement, it is true, is still possible, but the electrical locomotive no longer requires inventing. It is there and has come to stay.

TRANSMISSION OF POWER BY ELECTRICITY.*

The greatest achievement of the century which now approaches its close is the intimate connection that has been established between science and practice, the effects of which are noticeable in every feature of modern civilization, and in none more than in electrical engineering.

A little over thirty years ago the dynamo-electric machine was invented, which made electrical engineering of practical utility; but long before that time the laws of nature had been discovered by scientific research which govern the flow and the distribution of electric currents, Ohm's and Kirchhoff's laws, and which permit of the accurate measurement of the same, Weber's, Ampere's and last, but not least, Faraday's researches.

In no other domain of human activity has it ever been possible to attempt the solution of problems with an equal certainty of being able to criticize the proposed methods by the light of well-established scientific rules, and of avoiding unnecessary trouble and expense when these rules showed an error in the reasoning.

This facility of verifying results accounts for the rapidity of the progress of electrical engineering, and for the variety of purposes to which electricity is nowadays applied.

Among these transmission of power promises to become one of the most important, and it may not be uninteresting to study its development a little more in detail.

Although telegraph instruments and indicators generally belong, strictly speaking, to this branch of the subject, the term "transmission of power" is usually only applied to cases where electric motors are employed to convert electrical energy into mechanical motion.

The first important development took place in connection with electric tramways, starting from the small circular line exhibited in Berlin by Dr. Werner Siemens in 1879.

With our present experience there is no need to dwell on the advantages of electric traction in the streets of towns and their suburbs, and there is little doubt that in the near future horse and steam tramways will disappear everywhere.

Up to now cable traction has held its own in all cases where exceptionally heavy gradients have to be dealt with, but means are devised to overcome such gradients with the help of electric motors, and in this field the ultimate triumph of electricity is also assured.

This great success on tramways has naturally led to attempts to move the trains on the railways by means of electric locomotives, and it is well known that even the heaviest goods trains can be drawn by electric motors as well as by steam locomotives.

It would be a fallacy, however, to deduce from this fact the conclusion that it would be advantageous to replace the locomotives on all existing railways by electric motors, as the feasibility of such changes depends ultimately only on economical considerations.

The changes may be technically possible, but an alteration can only be introduced if a saving in expense is thereby effected.

This principle governs not only electric traction, but the whole field of human progress, which proves the necessity of investigating the economical aspects of a problem after its scientific features have been examined and found to be based on sound reasoning.

In the case of transmission of power there are three factors, common to all systems, which determine the cost of the motive power at the place where it is utilized, and thereby indicate what is the proper system to use.

* A paper read by Alexander Siemens before the British Association for the Advancement of Science.

The first factor is the source of the energy that is to be distributed.

The second is the means of transmitting; and

The third the apparatus for utilizing the energy.

With regard to the first point, the electric system is hampered by the fact that the available mechanical energy, however produced, has to be converted into electrical energy, and such a transformation always involves losses, which are avoided where the mechanical energy can be applied direct to the means of transmission.

As the cost of generating electricity decreases up to a certain point with the increase in size of the dynamos, it is desirable so to arrange the whole system that the units of the generating machinery can be constructed large enough to give the most economical results, and so to choose the site of the generating station that all the necessary supplies can be obtained in the cheapest manner.

In spite of the drawback mentioned above, electric transmission of power is applicable in a great many cases on account of the unquestionable superiority of the means of distributing electricity over the means of dealing with any other form of energy.

The ease with which the current can be carried over a long distance, the certainty with which the losses can be determined beforehand, and the flexibility of the conductors, constitute advantages which no other system presents, while the inevitable loss of the double conversion, added to the losses in the conductor, militate against the application of electricity in cases where the source of power and the apparatus for utilizing the same can be brought close together.

As the efficiency of electric motors has been accurately determined, there is no difficulty in predicting how much of the mechanical energy produced by the original source of power is available for useful purposes, and it is easy to ascertain from time to time that the desired electrical conditions are maintained.

It is well known that over 84 per cent. of the indicated horse power of a steam engine is available at the terminals of the dynamo in the form of electrical energy, and that electric motors will produce over 90 per cent. of the electrical energy supplied to them in the shape of mechanical power.

These high efficiencies were obtained at a comparatively early period, and it was therefore obvious that the main advancement in the electric system must be sought in diminishing the cost of the conductors without increasing the loss of energy during transmission.

Guided by the teachings of science, nearly all inventors have attacked this problem by suggesting an increase in the pressure of the current in one form or another.

Under the impulse of this tendency the art of insulating electric conductors has steadily improved, and while it was not long ago considered impracticable to work with currents of more than 2,000 volts pressure, there are now a number of successful electric systems employing currents of 10,000 volts pressure, and insulated conductors for even higher pressures can easily be obtained in the market.

More serious difficulties appeared when attempts were made to construct dynamos and motors for high pressure currents, and many ingenious devices have been suggested to overcome or to avoid them.

In case of alternate currents the employment of transformers permits the use of low-pressure generators and motors, while high-pressure currents transmit the energy through the conductors, but this advantage is obtained by introducing another loss through the double transformation.

Without much explanation it is easy to understand that the advantage of such a system is the greater the further the source of power and the motors are distant from each other.

Another advantage of this system is that the transformers have no moving parts, so that they require

next to no supervision, and that they do not occupy much space.

If an equally reliable current motor had been invented there is little doubt that this system of transmitting power would be the dominating one at the present time, but unfortunately alternating current motors up to now refuse to start without being first synchronized by external means, they are liable to stop abruptly when they are overloaded, and their speed cannot be varied.

A great step toward the solution of the problem was made when the possibility was discovered of combining three alternating currents in such a way that return wires can be dispensed with.

The result is brought about by employing three alternate currents with their phases differing by 120 degrees, so that their sum is at every moment zero.

At the same time a revolving magnetic field is produced in the field of the motor, so that its armature can start revolving without being first synchronized.

In certain cases it is not even necessary to supply currents to the armature, in which the currents will be induced by the revolving magnetic field, so that all difficulties of making contact with the revolving part of the motor are avoided.

As in the case of single-phase alternate currents, stationary transformers can be used with three-phase currents, which therefore present very conspicuous advantages for transmitting power.

On the other hand, a continuous current system is decidedly simpler, and consequently cheaper in first cost and cheaper in maintenance, provided the dynamos and motors can be well enough insulated to permit the use of high tension currents.

The transformation losses are avoided, and the motors can be made extremely efficient for large differences in their load, and their speed can be varied without much trouble, both qualities in which the three-phase motors are deficient.

As there are continuous current generators regularly supplying currents at more than 2,000 volts pressure, it is evident that this system can be applied in all cases where the distance between generator and motor is not excessive, and indeed in most cases where electricity is employed to distribute power in factories continuous currents are preferred.

Such an installation, viz., the electric plant at the works of Siemens Bros. & Co. at Charlton, was described by the author in December, 1894, before the North of England Institute of Mining and Mechanical Engineers at Newcastle-on-Tyne, and since that time very valuable experience has been gained there with regard to the suitability of electric motors for driving machinery.

Six years' work has shown that the system is perfectly reliable, and that the expected great saving in the cost of attending to the motive power has been fully realized.

During the year 1897, the output of the generating station was 1,178,286 B. T. U., or a load factor of .18. In May and June this year some tests were carried out to determine the consumption of coal and water per Board of Trade unit, and the output in one week was found to be during day time 21,283 B. T. U., or a load factor of .35, and during night time 6,047 B. T. U., or a load factor of just under .10.

During these trials Yorkshire hard coal was used, having an evaporation power of 13.8 pounds of water, as compared with Welsh coal, 14.5 pounds; in day time 5.13 pounds of coal were consumed per B. T. U., and at night 10.42 pounds, showing the immense influence of the load factor, while the average consumption was 6.55 pounds of Yorkshire coal per B. T. U.

Allowing for the difference in heating value the 1,178,286 B. T. U. in 1897 were produced by the burning of 3,282 tons of Welsh coal, while the boilers of the central station consumed altogether 6,514 tons.

It is therefore fair to charge half the actual expenses connected with the boilers to the generating of the electric current, while the other half falls on heating the works and driving some steam engines which have not been replaced by electric motors.

(To be continued.)

AN ELECTRIC POWER PLANT IN THE TRANSVAAL.

At the Sheba mine in the Transvaal an electric power plant has recently been established from which power is transmitted five miles to the mill. When the mine was first operated ore was hauled to the mills by ox-wagons, but later an aerial tramway was put in. This reduced the cost of transporting and milling the ore from $7.80 a ton to $1.46. The establishment of the new mill and the use of electricity generated by water power have, it is claimed, reduced the cost to the very low figure of 40 cents a ton.

In a paper recently read on this installation before the Institution of Civil Engineers in London, as reported in the *Engineering and Mining Journal*, Mr. W. B. Esson said the water power is obtained by a dam across the Queen's River, two miles above the generating station, to which the water was conveyed partly in open race and partly in tunnel. The maximum head derived was 32 ft. The turbines were of the Victor horizontal type, driving a countershaft at 300 revolutions per minute by ropes, and were together capable of developing 396 HP. They were provided with Snow governors, acting directly upon the turbine gate.

The generating plant consisted of three alternating-current dynamos supplying current at 3,300 volts. Each generated two alternating currents having a phase difference of 90°, and was capable of giving an output of 150 electrical HP. The armature was stationary and the field magnets rotated at a speed of 400 revolutions per minute. The stationary high-pressure coils were mounted on laminated iron sectors, which were laid close together in a strong cast iron cylindrical shell made in halves to form the armature. This was 54 in. in internal diameter by 12 in. wide, and within it the field-magnet rotated. Each coil was wound on a former, and had 63 turns of double cotton covered wire 0.12 in. by 0.09 in. in seven layers. The adjacent layers are carefully insulated by micanite cloth, while the complete coil was boiled in paraffin, and was afterwards heavily covered with impregnated tape to a thickness of 1-16 in. In addition, during the process of mounting, a trough of fiber was interposed between the coil and the iron core.

There were 14 coils on the armature, the seven upper coils being for one phase and the seven lower coils for the other; each therefore contributed about 470 volts to the circuit. The coils were displaced to give the phase-difference by the interposition of idle laminated sectors. The field magnet was excited by a single coil and consisted of a steel wheel, from the rim of which projected two series of poles, N on one side of the coil and S on the other. The poles were expanded on the face and were curved to form a circle of 16 alternate faces, which were presented to the armature core, with an air-gap of 0.33 in. The exciting coil was wound on a cast-iron drum placed in the middle, between the projecting poles, and was positively driven by a couple of pins screwed into the steel casting. It terminated in a pair of gun-metal rings lying side by side upon, and insulated from, a substantial cast-iron brush, which in turn was keyed upon the shaft. The exciters were ordinary two-pole upright machines.

For throwing the alternators into parallel the incoming alternator was plugged on to the synchronizing bars, and when approximate synchronism was indicated by the hot-wire voltmeters it was thrown into the main circuit by closing, through a large choking coil, a path between the synchronizing bars and the main omnibus bars. The choking-coil prevented a large rush of current, due to difference of phase, between the alternators, though at the same time allowing sufficient current to pass to pull the new machine into step. The current was transmitted by cables to the mine, and at the receiving house the pressure was reduced to 100 volts for driving motors and lighting the workings. The frequency at which the plant worked was 53.3 per second. The conductors were laid underground, and consisted of concentric cables insulated with impregnated jute covered with lead and armored. There was no fall of potential due to self-induction in the cables, nor had the current in one pair of conductors any inductive effect on the neighboring pair. But when overhead wires were employed, the conductors, being of necessity some distance apart, there was not only a fall of potential due to self-induction in the lines, but unless precautions were taken the mutual induction of the circuits carrying currents of a quarter-phase displacement tended to produce inductive dissymmetry throughout the system.

At the receiving-house there were four transformers of 50 KW. capacity, two for each phase; those reduced the pressure from 3,000 volts to 100 volts. The motors were of the induction type; their construction was fully described, and the author also explained their working under varying conditions and gave a brief account of the laws which governed their action.

The crushing mill at Sheba worked night and day; and in one year, of the possible 365 days of 24 hours each, the pressure had been cut off the conductors for only 4 days 8 hours 22 minutes, which had been chiefly occupied in inspecting the water race, overhauling the belts, ropes, etc., and in executing general repairs to the machinery. The efficiency of the plant from the turbine shafts at the generating station to the motor shafts at the mine might be taken at 70 per cent.

What Instrument Will They Use?

Frank S. Gardner, secretary of the new People's Telephone Company, New York, was asked a few days ago by a representative of the *Evening Post* what telephone his company would use when it began business, the statement having been repeatedly made in behalf of the present (New York Telephone) company that they controlled all the available telephones and the patents in relation thereto. Mr. Gardner in reply said he must for the present decline to give the desired information, but he added that the public might rest assured that his company would be ready for business in a few months, and that as a telephone company could not do business without a telephone and the other necessary paraphernalia, it followed that the People's Company were not making contracts to give a telephone service without having a telephone. More than that he could not say at present.

LONDON NOTES.

[From our London Correspondent.]

The "Underground" Railway and Electricity.

Contracts have just been placed for a series of experiments in electrical working on the Metropolitan Underground Railway. For many years the matter has been under the eye of the Metropolitan and Metropolitan District Company directors, and to the present trials each company contributes a moiety amounting to $50,000. Under the guidance of Sir J. Wolfe Barry and Mr. W. H. Preece, work will be immediately proceeded with for putting down a generating station and plant, temporary in character, equal to the haulage of the heaviest train run on the lines. The train will be run between Earl's Court and High street, Kensington, because the gradients are steep—sometimes 1 in 40—and because the ordinary service at this point is not so frequent as at other points. Therefore the electrical system will be tested under the severest conditions likely to be imposed, and in this way the companies and their advisers will be able to see whether it is advisable to proceed with the electrical equipment of the entire railways. There will be no interruption to the ordinary steam service during the trials, which are expected to be started next summer and to be continued for about eight or ten months. Two conductors are to be laid parallel between each of the lines of the permanent way, and these will be of a permanent nature so as to be of use when the complete equipment is carried out. There are those who hold that the Metropolitan companies need have no hesitation in carrying out a complete conversion without making these experiments, American experience being amply sufficient to go upon, but the directors do not feel inclined to lay out two and a half million dollars (the estimated cost), without having first demonstrated to their own and their shareholders' satisfaction of what electricity is capable when applied to a line with the peculiar features of the Metropolitan. To those who have to use the railway the likelihood of a change is very welcome.

The English Telephone Service.

Applications continue to be made to the Postmaster-General for municipal telephone licenses. It appears however that there is some action in contemplation by the Government during the forthcoming Parliamentary session. The Manchester Corporation, which has long been anxious to secure an improvement in the present service, has decided to withdraw its application for a license to establish an exchange, simply because of the anticipated action on the part of the Government. Does this mean that a proposal is coming forward for the immediate purchase of the monopoly instead of waiting until 1911? Whatever the developments may be, the above announcement possesses special significance.

Electric Traction Economies.

In ELECTRICITY a few weeks ago was notified the opening of an experimental trolley line at Glasgow. Mr. Young, the tramway manager, now reports to the Corporation that the cost per car mile for a fortnight has worked out at 6½d. and the receipts at 1s. 4½d. a profit of 10d. per car mile. These figures have been produced to convince the Corporation of the economy that would result from the electrical equipment of the other 28 miles of track. Mr. Young has also drawn up estimates showing how much greater will be the initial outlay and the working cost if the conduit system is introduced on the entire city service. The Corporation will shortly consider the matter, and doubtless ere long there will be some good contracts to let at Glasgow for traction material. The figures showing the cost of operating the New York conduit system are being widely circulated here, and are creating a feeling in some quarters in favor of the conduit.

THE MECHANICS' FAIR, BOSTON.

Attractive Electrical Exhibits of Various Companies.

At the 20th Triennial Fair of the Massachusetts Charitable Mechanic Association, at this moment in the zenith of its popularity judging from the crowds which daily throng its capacious building in every part, electricity, in almost every phase of the art and science, forms without doubt the most extensive and popular attraction.

Nothing, surely, shows like changes and development as does that of illumination as shown in the marvelous transformation of the "tallow dip" and whale-oil torch in popular use when Paul Revere of historic renown was chosen first president of the Massachusetts Association into the brilliant electric lamps which to-day render the exhibition now being held a marvel of light and artistic effects, alike on the exterior and throughout the interior of the mammoth exhibition buildings.

But "illuminating" does not by any means represent the sum total of what electricity is doing at this exhibition. By far the larger portion of the machinery is operated by the same force, and even the "fun of the fair," including communication with far distant places, is entirely of an electrical character, for while enjoying the exciting wonders of the biograph in the "Fair theater" the patrons are listening to concerts and other amusements going on in theaters all over the New England States and even in Canada by means of innumerable long distance telephone lines.

Prominent among the historic electrical features are the beautiful group of wax tableaux shown by the Eden Musee Company of New York. These tableaux represent the following incidents: A Syrian woman discovering electricity in her amber spindle anterior to the Christian Era; the punishment of a sailor for falsifying a ship's compass in the 12th century; Dr. Gilbert explaining the terrella to Queen Elizabeth, A. D. 1600; Stephen Gray experimenting on the conduction of electricity, A. D. 1720; Dean von Kleist bottling electricity in a Leyden jar, A. D. 1746; Ben Franklin drawing lightning from the clouds in 1752; Galvani's famous frog experiment; Michael Faraday's experiment with the first dynamo-electric machine, A. D. 1831. From the day when the exhibition was opened there has been no time when these realistic figures have not been surrounded by a wondering crowd of spectators.

Another attractive electrical feature is the blowing up of miniature war ships by wireless telegraphy as exhibited at the Electrical Exhibition in New York. Not only does the United Electrical Supply Company of New York City make this exhibit, but it has a complete X-ray outfit that is visited by everybody, an acetylene gas generator, a thermo-electric generator and other up-to-date appliances, the varied and practical uses of which are explained by competent attendants in charge of the various exhibits.

Blodgett Bros. & Co., Boston, exhibit a large and handsome clock with four faces, placed on top of a tall column in the center of the main hall and kept revolving by means of electricity. In their booth the same firm exhibits a full line of clocks for schools, colleges, town halls and other public buildings, all of which are regulated by the electric current. Messrs. Blodgett enjoy what is practically a monopoly of manufacturing and installing public timekeepers having electrical controlling features.

The Buckeye Electric Company of Cleveland, O., has an attractive exhibit of vari-colored incandescent lamps of all voltages and many of artistic form.

The Edison Electric Illuminating Company of Boston makes the most extensive of the electrical exhibits. It covers no less than 2,184 feet of space on the floor of the central hall. It is in the form of a handsome archway, having three aisles, supported by massive columns, the open-work frame being covered with an abundance of long tendrils of smilax fresh gathered every few days, the rich green of which, in contrast with the white-painted columns and rafters, produces a most striking effect. Of the three sections or aisles in this booth, the central one is devoted to ornamental incandescent lighting by means of miniature lamps so arranged as to produce brilliant, interesting and novel effects. In one of the side aisles are exhibited incandescent and arc lamps, showing the most improved and efficient types of lamps, ranging from 8 to 100 CP.; also standard enclosed arc lamps, ranging from 400 to 2,000 CP. There is on display too in this section a "photometer" and a "prepayment meter," operated on the "nickel-in-the-slot" plan, together with many other interesting devices. In the opposite aisle the application of electricity to cooking, baking and various domestic uses are displayed in actual operation. A very powerful searchlight is shown, while printing and other machines are being run by electricity. There are nearly 6,000 lamps used in the Edison exhibit, which is the most crowded place in the entire fair.

The General Electric Company's exhibit consists of a huge globe, representing the earth, 25 feet 4 inches in diameter and mounted on a suitable pedestal (the same was exhibited at the Street Railway Convention). On the surface of this mammoth sphere are shown the exact geographical locations of the various oceans, seas, continents, islands and archipelagos scattered over the globe and drawn to a scale of 312 miles to one foot. Each nationality is indicated by its national flag placed on the country it represents, while at night over 400 diminutive colored incandescent lamps mark the location of representative installations of General Electric plants. Encircling the globe at the equator is a flattened ring forming a railway track on which runs a small electric car which makes the circuit of the earth once in twenty seconds. The interior of the globe is fitted up as a handsome reception room, while the palisading around the entire lot is designed of various sized gear wheels, car controllers, etc. In addition to this handsome exhibit the General Electric Company furnishes the motors and generators which operate the various shoe, printing and other machines as well as lights many of the exhibits.

The Holtzer Cabot Electric Company of Boston has an unusually attractive display of its well-known high grade electrical apparatus. This includes fan motors of rich design, complete telephone systems, dynamos for electroplating, generators for lighting and power purposes, handsome switchboards and a unique array of appliances for domestic uses. Their electrically-operated bandage winder for hospitals and dental machines attract everybody's attention. This is one of the most varied and interesting exhibits of an electrical character there is in the fair.

The Incandescent Electric Lamp Manipulator Company, whose head office is in Boston with factory at Hyde Park, Mass., makes a fine show of its novelty that is taking the users of lamps by storm. It is a very handy device for removing and replacing burnt out or other incandescent lamps in out-of-the way, beyond-the-reach places, as in store windows, the lofty ceilings of theaters, music halls, courts of justice, churches and other public places. A child can use it if necessary because of its simplicity, and lamps can easily be reached from 40 to 50 feet away by means of its extension rod. It is without doubt the cleverest device for the purpose ever invented and is having an enormous sale.

The Jandus Electric Company of Cleveland, O., has a handsome display of enclosed arc lamps for use on direct or alternating currents, for series work, railway work, and on different voltages. These lamps are of various sizes, designs and candle power capacity and are said to be in growing demand everywhere.

The Lombard Water Wheel Governor Company,

Roxbury, Mass., makes a display of its efficient specialty in operation. This governor being made in several sizes is adapted for use in a variety of places, and with the speed recorders, also manufactured by this company, forms a combination of the highest efficiency. This governor is now in general use at all of the great water powers in the country.

The Maxham Electric Third Rail Company has a track laid, equipped with its third rail device, and over this section of track a small car runs in demonstration of the value of this solution of the problem of street car propulsion.

The Moore Electrical Company of Newark, N. J., exhibits Mr. D. McFarlan Moore's system of vacuum tube lighting in a most unique and artistic manner. "Moore's Parlor" is a very attractive spot in the fair. It is crowded every hour of the day. The handsome appointments of the "parlor" are shown to great advantage in the flood of "artificial daylight," which it is claimed is to be the method of interior illumination in the future.

The New England Telephone & Telegraph Company has a number of booths located about the fair buildings in which the public can transmit messages over long distance lines or enjoy the music that is being discoursed in theaters and music halls in far distant cities. A very enjoyable telephonic feature too is the liberal use of a number of instruments by the free use of which anyone can enjoy the continuous performances in Keith's New Theater in Boston.

There is quite a large and varied exhibit of motovehicles, including those run by steam, gasoline, petroleum and electricity. The "Columbia" types attract attention, as do several others made in Waltham, Mass., and elsewhere. The Riker Electric Company, Brooklyn, N. Y., has quite an array of heavy and handsome delivery wagons, tricycles, quadracycles and other vehicles, and the manner in which the attendant demonstrates the safe and handy way of operating any one of them attracts a wondering crowd all day long.

Whitman & Couch, Boston, who are now so well known in the independent telephone field, make an unusually fine exhibit of their apparatus, both complete telephone installations and also the various individual pieces of apparatus.

James L. Russell, Boston, representing some of the best specialties in the electrical field, has a brilliant exhibit of the Nowotny long-burning enclosed arc lamps of artistic design, generators and motors made by the Onondaga Dynamo Company of Syracuse, also a handsome switchboard on which are displayed a variety of instruments made by the S. E. S. Company of Syracuse, N. Y., and a Philbrick mast-arm.

The Ridgeway Dynamo & Engine Company, Ridgeway, N. J., represented by Mr. J. L. Kimball for the New England States, exhibits a 75 KW. dynamo directly connected with one of their high speed engines. With this combination part of the fair is illuminated by arc lights, and the brilliancy and steadiness of this special system make much favorable comment.

The Burton Electric Smelting Company, Boston, shows a complete outfit for melting ores by means of an electric current, and included in the same exhibit is an electric forge at which two men work right along making various articles of iron and steel, also a small electric leather tanning plant, in demonstration of the practical value of these various inventions made by Mr. George D. Burton.

As might be expected at a fair like this there is an extensive display of gas engines, hot air engines, compressed air devices, as well as many types of steam engines, also the Diesel motor, all of them in practical operation running machinery of various kinds. These illustrate the rapid and improved changes which are constantly taking place in the evolution of more efficient and economical power generators, but by far the most striking and attractive exhibits are those in which the electric current is the operating medium. K.

CANADIAN NOTES.

Messrs. Nesbitt, Gauld & Dickson of Hamilton, Ont., are applying to the Ontario Legislature for an act to incorporate the Hamilton & Caledonia Railway Company. The idea of the promoters of the railway is to build an electric line from the city of Hamilton to Caledonia, and to extend it to the village of Selkirk.

The south shore at the Lachine Rapids, Quebec Province, will soon be able to boast of hydraulic works similar to those on the north shore of the Rapids which belong to the Lachine Hydraulic & Power Company. A company has been formed, composed of Canadians and New York capitalists. Work is expected to begin next spring, the promoters of the company intending to study during the coming winter the effect of the frazil ice in the chutes of the Lachine Power Company dam. To create the required fall the new company will have to dam Isle du Diable to the mainland, at the head of the rapids, and lower from the same island to the Isle du Paquette. When once this new water power is created the city of Montreal will then have another electric company to supply its citizens with light and power for manufacturing purposes, with the advantage of several competitive companies to select from.

The largest electric light dynamo in Canada has just been installed in the new power house of the Ottawa Electric Company near the suspension bridge at the Chaudiere Falls. It is of the Westinghouse type with a capacity of some 10,000 lights. The machine is very massive and weighs 23 tons. This dynamo will supply current for the lighting of the Parliament and Departmental buildings of Ottawa.

Exports of Electrical Material from New York.

The following are the exports of electrical material from the port of New York for the week ending November 29:

Brazil—653 packages, $7,002.
British East Indies—147 packages, $4,456.
Bremen—15 cases, $3,000.
British Possessions in Africa—47 cases, $1,805.
Chili—9 cases, $403.
China—28 cases, $1,417.
Hong Kong—26 cases, $968.
Hamburg—102 cases, $11,006.
Liverpool—29 cases, $635.
London—128 cases, $8,900.
Southampton—2 cases, $104.
U. S. of Colombia—3 cases, $1,650.
Venezuela—357 cases, $1,127.

THE NEWS.

What is Going On in the Electrical World.

LIGHTING.

Camden, N. J.—The lighting committee of the city council has decided to readvertise for bids for lighting the city with electric lights because of the withdrawal of the certiorari proceedings against the bid of the Citizens' Light, Heat & Power Company.

Carthage, Mo.—At the special election held here on the 22d ult. to get a public vote on the proposition to authorize the city council to issue $25,000 in bonds for the purpose of building and maintaining an electric light plant, the proposition was carried by a large majority.

Fredericksburg, Va.—The city council has ordered an election for the ratification or rejection of a resolution which passed that body for the erection of an electric light plant at an approximate cost of $11,600.

Forsyth, Ga.—The vote here at the special election to decide the question of bonding the town to put in an electric light plant was 109 for to 27 against, which means the erection of a plant at an early day.

Herkimer, N. Y.—"Two weeks ago," says the Herkimer "Citizen" of the 29th ult., "the municipal commission awarded the contract for the construction of the incandescent electric system to the Westinghouse Company of Pittsburg for $10,500, and a contract according to the agreement made with the agents was sent to the company to sign. It was held until the 26th inst. and returned with the clause stricken out providing a forfeiture of $25 per day for failure to complete the work within the specified time of sixty days, which was the time named by the company. Village Attorney Steele advised the commission against accepting the revised contract and it was rejected. The commission are justly indignant at the action of the company."

Johnstown, N. Y.—General W. F. Lansing has made application to the council for a franchise "authorizing the introduction of electric power for lighting, heating," etc., in this city.

Little Falls, Minn.—The council has passed a resolution offering to purchase the local water and electric plant from the company for $45,000, the proposition to be good until December 20.

Newark, N. J.—The People's Electric Light & Power Company of this city has issued a circular to its out-of-town patrons and prospective consumers of current. The company recently made a cut in the rates for domestic service and the reduction proffered in the new circular amounts to from 7½ to 13½ per cent. upon the present prices. This reduction will cover all territory comprised in Jersey City, Bayonne, Irvington, Clinton, Vailsburg, Orange, East Orange, West Orange, South Orange, Bloomfield, Montclair, Caldwell, Verona, Harrison and Kearny, and will be from the schedule of prices as now charged in the different towns to a uniform rate of 13 cents per kilowatt for current, not including lamp renewals.

New Orleans.—The Crescent City Electric Light Company, which proposes to erect an electric plant in this city for lighting and power purposes, has been formally organized. The following officers have been elected: President, Joseph H. DeGrange; secretary-treasurer, Sidney H. March; general manager, J. B. Craven; attorney, E. D. Saunders. Among the leading men interested in the undertaking as stockholders are Isidore Newman, S. Gumbel, Isidore Hechinger, H. R. Gogrieve, William Oswald, Alfred Hiller, Paul Godchaux, Sidney White and J. W. Murphy. The company is organized under the grant given by the council in the name of T. M. Miller.

Norfolk, Va.—The entire city of Norfolk was plunged in total darkness on the night of the 30th ult. by the blowing out of a valve on the main engine at the Virginia Electric Light Works.

Richmond, Ky.—An electric light plant will be established here at once by B. F. Adair and others who have purchased a site for the power house. The company hopes to turn on lights within ninety days.

Rochester, N. Y.—Mayor Warner is an earnest advocate of municipal lighting and is preparing a communication on the subject which he intends to present to the council. The present contract for lighting the city is held by the Rochester Gas & Electric Company. It was executed in the summer of 1897 for a period of five years. That leaves it about three and one-half years yet to run.

Tupper Lake, N. Y.—The Tupper Lake "Herald" says: "A gentleman from Utica representing an electric light plant has been in town the past week considering the feasibility of establishing such an industry in our town. We understand that the result has been very gratifying and that he has practically decided to put in the system, a large number of lights having been guaranteed."

Watervliet, N. Y.—The electric light board has decided on lighting all the public buildings with electricity. The following members were appointed to look after the wiring: Aldermen Bridgman, Baxter and Mitchell.

STREET RAILWAYS.

Albany, N. Y.—It is only a matter of a short time when a continuous chain of electric railways will extend from Albany to Saratoga. The latest link in the chain is the proposed line from Schuylerville to Greenwich, which is already under way. It will be five miles long and will pass through Clark's Mills and Middle Falls. Joseph A. Powers, who is president of the Stillwater & Mechanicville Electric Railway, is one of the prime movers in the new road.

Astoria, Ore.—The city council has granted to F. D. Kuettner a street railway franchise covering all the streets in the city for 75 years. The franchise provides that Mr. Kuettner must acquire the present street-car system within one year.

Chicago.—The Sprague multiple unit system is now in successful operation on the South Side Elevated road and is receiving favorable notice from the press. The fundamental principle of the system is that each car has its own motive power, its own lighting and heating plant and is entirely independent of the rest of the train.

Flint, Mich.—Another electric railway project for a road between Flint and Long Lake, distance 18 miles, is announced. R. M. Luton of Grand Rapids is the promoter.

Harrison, N. Y.—The Port Chester Electric Railway Company has been unsuccessful in getting the consent of the requisite number of property holders along its proposed route on Halstead, Rye Beach and Harrison avenues, and has applied to the Appellate Division of the Supreme Court to appoint a commission to decide on the necessity of building the line.

Harrisburg, Pa.—Twenty-five per cent. of the entire capital stock of the street railways of Pennsylvania operating their own or other lines is that issued by the Consolidated Traction Company of Allegheny county. The total amount of capital stock outstanding of the ninety-four street railway companies in the State operating their own and other lines is $100,909,335. In addition to the amount of capital stock outstanding by

lessor companies there is $56,027,922, the capital stock outstanding of the corporations whose lines are owned or operated by lessor corporations. The figures are taken from the advance sheets of the annual report of Major Isaac B. Brown, Chief of the State Bureau of Railways, for the fiscal year ended June 30 last. Major Brown recommends that the provisions of the constitution which prohibit fictitious capitalization should be strongly enforced, and declares that this can only be done by additional legislation empowering the officials of the Commonwealth to exercise greater supervision over these corporations. He says further that when it is found that many of the roads are capitalized at three or four times of the probable cost it is not difficult to discover the system of financiering that has characterized their management.

Kansas City, Mo.—A number of prominent contractors of the country have been invited to submit bids for the construction of the Northeast Electric Street Railroad, the necessary specifications for the estimates having been sent to them. The bids are to be opened within 30 days at the company's office in Kansas City, and the work awarded. One of the specifications is that the reconstruction of the road must be commenced at once and be completed within four months.

Key West, Fla.—The board of aldermen has granted a street car and lighting franchise to the Messrs. Laflin, who are the principal owners in the Key West Electric Company which has just absorbed the Key West Gas & Electric Company.

Los Angeles, Cal.—T. E. Gibbon and William S. Hook have petitioned the council to advertise for sale a franchise for a double track electric street railway on Santa Fe avenue and other streets in this city.

Metuchen, N. J.—The Plainfield & Metuchen Street Railway Company has secured rights of way over a large portion of the route proposed for its trolley road between Plainfield and Metuchen and expects to begin work on the road early in the spring.

New York.—The snow storm last week hindered work on the conduits now being laid in miles of the city streets by the street railway companies, but gangs of men were kept busy shoveling out the snow and the mud from the trenches and enabled the workers on the conduit construction to resume their operations as soon as the storm was over.—The car house of the Union Railway Company at Boston avenue and Woodruff street was totally destroyed by fire on Wednesday last. Seventy-five cars in the building were also destroyed together with a lot of electrical machinery, and the total damage is estimated at $150,000. The insurance on the property is $100,000.

Philadelphia.—The Central Electric Railway Company of Philadelphia and Delaware counties has taken preliminary steps to erect a network of trolley lines through Delaware County towns. The lines will reach Yeadon, Cardington, Llanerch, Lansdowne, Marple township, Media, Wallingford and Clifton Heights. They will connect with the Delaware county road and the Chester and Media Railway.

Providence, R. I.—The Providence & Greenwich Electric Traction Association has completed its organization. The Association proposes to build an electric railway between this city and East Greenwich.

South Bend, Ind.—The street car lines in this city, on which there was no service for four months, are running again, having been entirely rebuilt and re-equipped at an expense of $200,000. As soon as the weather will permit work will begin on lines connecting South Bend with Niles, Mich., and Goshen and Elkhart, Ind., making with the present lines forty-six miles of electric street railway. The present city and suburban lines cover fifteen miles.

West Chester, Pa.—The tracks of the Philadelphia, Castle Rock & West Chester Railway reached this place on the 29th ult., and cars will be running over the line in a few days. This railway commences at Sixty-second and Market streets, Philadelphia, and terminates in West Chester, the length being twenty-two miles.

MANUFACTURING, ETC.

Springfield, Ill.—The Westinghouse Electric & Manufacturing Company has been licensed for business in Illinois with a capital of $29,000.

Toledo, O.—The firm of W. G. Nagel & Co. has been organized for the purpose of conducting a general business in electrical machinery, supplies and construction in Toledo.

Troy, N. Y.—The E. G. Bernard Company of this city has closed another contract with the United States Government. This company will install an electric lighting and ventilating plant in the Coast Survey steamer Blue, Captain Wainwright commanding. This vessel is now being fitted at Baltimore for a trip to Porto Rico.

Washington, D. C.—In his annual report Consul Roosevelt of Brussels says: "The employment of electricity for illuminating purposes is rapidly extending in this city. The lamps as well as nearly all other electrical supplies here are of German origin; Holland supplies a few and England a fair percentage of the electrical wires employed. American lamps and other electrical goods are exposed for sale on this market, and are conceded to be superior to those imported from Germany, France and England, and with proper effort the trade in this line could be greatly increased. Especially in copper wire, insulated wire, large cables and arc lamps is there an excellent opening."

POWER AND TRANSMISSION PLANTS.

Buffalo, N. Y.—The Buffalo Railway Company has for some time been using electric current from Niagara Falls to run its cars, and now the lighting company is using the same power in its lighting service. In this case Niagara Falls electricity is not applied directly to the lamps. The electric light company uses the power in a motor which operates a dynamo, which, in turn, generates the electricity for the lights. As soon as the new power plant of the company is finished all the city lamps will be lighted with the aid of the new power.

Cleveland, O.—One of the heaviest applications of electric power to machine tools is an angle iron cutting machine designed for one of the largest iron companies. An electric motor is directly geared to the shearing machine, which is capable of cutting bars up to 8 inches by 1 inch thick and this, too, without destroying or distorting the piece cut off.

Wrightsville, Pa.—The Susquehanna & Tidewater Canal is to be opened next year for service and the boats will be propelled by electricity from a plant now in course of construction at Wrightsville, where the Martic Water & Power Company are building a dam and preparing to erect a power house in which machinery capable of generating 4,000 horse power will be installed. The canal extends from Wrightsville to Havre de Grace. The officers of the Martic Water & Power Company are: President and chief engineer, James H. Harlow; treasurer, George K. McGaw of Baltimore, Md.; secretary, Stephen J. Caldwell of Cecil County, Md.

MINES, ETC.

Cumberland, Md.—The Cumberland & Elk Lick Coal Company has just put in an electric generator of ponderous proportions which pulls twenty or more loaded mine cars on a trip. The mine has also in successful operation an electric pump which keeps the mine clear of water. The Merchants' Coal Company, operating in the Elk Lick region, has an electric plant which is a model in every detail. It is principally used in undermining the coal. The apparatus consists of a motor stationed on a sliding carriage and propels an endless chain, upon which are a number of steel claws, not unlike the teeth of a large circular saw. The machine is stanchly braced up against the breast of the coal and the current turned on. The chain begins to revolve rapidly and the claws are forced into the coal, cutting clear and clean 42 inches wide to a depth of seven feet under the coal in a few minutes. This operation is repeated until the full width of the breast is undermined. The machine is then loaded upon a truck, requiring but a few minutes, and is removed to another room. The miners of the room that has been undermined "put in a shot" and discharge it, knocking down the entire breast of coal. As high as eleven cars of coal have been loaded from one shot.

Denver, Col.—The Colorado Springs correspondent of the Denver "Republican" writes: "D. V. Donaldson has recently returned from camp, where he has been in the interests of the Colorado Electric Power Company, and brings back a flattering report of the way in which electricity is revolutionizing the mining methods of the camp. Among the new properties that have taken power is the Las Mobile Company, which has put a No. 3 hoist on the Last Chance to work the recent strike on that property. The Findley has put in power on the Randall lease. The Lake City Mining Company on the Wisconsin, the Mary Anne on Raven hill and the Badger Boy have put in plants within a week. Taken altogether, Mr. Donaldson is greatly pleased with the outlook and says that electricity is already revolutionizing methods at camp."

COMPANY MATTERS.

Clyde, N. Y.—The Clyde Gas & Electric Company of Clyde has bonded its entire plant for $25,000 and to secure the bonds has put a blanket mortgage on the plant for $25,000 to the Trust & Deposit Company of Syracuse.

Cincinnati.—The machinists of the Bullock Electrical Manufacturing Company, of Norwood, about 500 in number, have again gone on strike. The trouble started several months ago, the company having introduced the piece-work system, to which the men object. It then resulted in a strike. The company, however, agreed that the men should be restored and that they would not be put on piece-work, but the men claim that the company has failed to live up to its agreement.

New Haven, Conn.—A charter is to be applied for before the next Legislature for a trolley road from Southington to Waterbury, a distance of about ten miles. The new line will be a parallel of the Waterbury, Meriden & Connecticut River Road soon to be reopened. The trolley line between Stratford and Milford is soon to be double-tracked.

Philadelphia.—The Technic Electrical Works, a corporation under the laws of New Jersey, made an assignment on the 1st inst. for the benefit of creditors to Richard L. Binder.

Springfield, Mass.—A meeting of the stockholders of the Northampton-Amherst Street Railway Company was held in this city last week. The purpose of the meeting was to call in 10 per cent. of the capital stock, and to push the matter of application for a charter as an incorporated company, and to fix other details of organization.

PERSONAL AND MISCELLANEA.

On the night of the 29th ult. at Scranton, Pa., Charles Asperschlager, engineer at the Dickson Manufacturing Company's Cliff Works, while using an iron rod to turn the switch of an arc lamp was instantly killed by an electric shock. He was standing on an iron rail when trying to move the switch with the rod. He was 30 years old.

The Detroit "Journal" says of A. B. Du Pont, general manager of the Citizens' Street Railway, Detroit, that "he is an authority on electric roads and their practical management, and is credited with being able to make the electric current and transmit it over the wires at less cost than any other man in this part of the country."

General Manager Charles R. Huntley of the Buffalo General Electric Company is reported to have been cured of pneumonia by electricity and without the aid of any medicine. When the doctors pronounced Mr. Huntley's disease pneumonia he got an electrotherm or electric heating pad, which looked like a big rubber plaster. It was eleven inches wide, fifteen inches long and less than half an inch thick, and Mr. Huntley's description of its application as given in the Buffalo papers is as follows: "Attached to the pad was an insulated conducting cord fifteen feet long, with a regular switch and a plug. The nurse attached the end of the cord to an incandescent lamp socket and turned on the current. The mat or rubber plaster was laid on Mr. Huntley's chest and kept there for a week. A thermostat was attached to it, cutting off the current after it got beyond a certain heat, prescribed by the doctors. Three degrees of heat were possible: One, 120, another 140, and the third 160. Within ten days Mr. Huntley was up and about the house and on the tenth day he was out attending to business as usual and shows not a sign of a struggle with pneumonia. The life saving mat he used is composed of asbestos insulated wires woven into a flexible mat or pad, which, when attached to the ordinary incandescent lamp socket affords sufficient resistance to the electric current to produce a constant and uniform degree of heat. It is of value as a substitute for hot-water bags and other bothersome methods of applying and maintaining artificial heat in local applications. It is simply devised and cannot burn the patient. It is made from any voltage from 5 to 125 and can be used with either direct or alternating current. The switch regulates the temperature to any required degree, preventing the possibility of accidental overheating. The thermostat or temperature regulator is incorporated in the mat and automatically interrupts the current and operates to keep the temperature within the prescribed limit."

RECENT COMPANY ELECTIONS.

Anacostia Street Railway Company, Washington, D. C.—President, F. C. Stevens; directors: F. C. Stevens, H. D. Mirick, Oscar T. Crosby, C. A. Leib and Messrs. Minor and Griswold. The two latter are the receivers of the road.

Dayton & Xenia Traction Company, Dayton, O.—President, Levi Weiskopf; treasurer, Alfred Hill, both of Cincinnati.

West End Street Railway Company, Boston.—Directors: G. T. W. Braman, Richard M. Saltonstall, Parkman Dexter, Walter S Swan, Albert C. Houghton, C. Minot Weld, Samuel Little, Stephen W. Weld, Joseph B. Russell, Chas. A. Williams, Samuel Spencer, Moses Williams, Alfred Winsor. Messrs. Parkman Dexter, C. Minot Weld and Charles A. Williams succeed T. Jefferson Coolidge, William Hooper and Henry D. Hyde.

COMMERCIAL PARAGRAPHS.

The Electric Appliance Company, Chicago, report that they are meeting with splendid success with the 98 Model Packard Transformer and that it is more than fulfilling all the claims and guarantees that they have made.

Brass Socket Causes Death.

Pass & Seymour, Syracuse, N. Y., have received a letter from R. I. Holding, Salt Lake City, Utah, stating that Louis Kayazer, an engineer at the Seattle Steam Laundry, was killed by an electric shock received while he was changing a small globe from one socket to another, his hand coming in contact with the socket. Mr. Holding in his letter says: "This is a strong recommendation in favor of your porcelain socket, for had they been in use in this instance one man would not have been called to an untimely end."

"Peerless" Secures First Prize.

Some time since the Warren Electric & Specialty Company, manufacturers of incandescent lamps, Warren, O., organized a contest for a choice of name for their new lamp. The judges have just rendered their decision, and the following is a list of those persons who were awarded prizes:

First prize, $50, "Peerless."—Joe E. Calloway, Pueblo, Colo.; Jno. C. Watson, Charlotte, N. C.; J. W. Freeman, Joplin, Mo.

Second prize, $30, "Wesco."—K. W. Mansfield, South Norwalk, Ct.; Gugler Electric Company, Minneapolis, Minn.; J. E. Calloway, Pueblo, Colo.; H. P. Ayer, Portland, Me.; J. S. Daily, Chillicothe, Ill.; New Orleans Electric Company, New Orleans, La.; C. J. Wetsel, Chicopee Falls, Mass.

Third prize, $20, "Liberty."—W. H. Schott, Chicago, Ill.; Joe E. Calloway, Pueblo, Colo.; A. D. Scatcherd, Batavia,

N. Y.; Chas. Frankish, Ontario, Cal.; Phillip Hickley, Chicago, Ill.

Fourth prize, $10, "Aladdin," "Aurora," "Eclipse," "Encore."—Thos. Day Co., San Francisco, Cal.; D. A. Gill, Kansas City, Mo.; Lemuel K. Cushing, Chicago, Ill.; H. L. Brintnall, Saginaw E. S., Mich.

INCORPORATIONS.

The Delaware Electric Light & Power Company (incorporated at Albany, N. Y.). Authorized capital, $250,000. Incorporators: P. G. Stappens, D. McM. Niven, C. W. Phillips, New York City.

The Carter-Hays Electric Company, Louisville, Ky.—to manufacture, repair, buy and sell electrical appliances. Capital stock, $5,000. Incorporators: L. D. Carter, E. W. Hays and H. O. Hays, Louisville.

The Pacific Trading Company, Tacoma, Wash.—to erect and run factories, build and operate telegraph and telephone lines, power plants, etc. Incorporators: J. W. Garbin, F. H. Chandler and C. McDaniels.

The Red Lake Electric Light Company, Red Lake, Minn. Capital stock, $8,000. Incorporators: Marcus Johnson of Atwater, Anna F. Marshall and L. R. Simons of Red Lake Falls.

The Acme Electric Lamp Company, New Brunswick, N. J.—to manufacture lamps, etc. Capital stock, $500,000, of which $200,000 is preferred. Incorporators: Louis A. Jackson of New York, Ralph W. Booth, Sr., and Ralph W. Booth, Jr. A plant will be erected in New Brunswick.

The Vicksburg Electrical Supply Company, Vicksburg, Miss.—to manufacture and deal in electrical supplies, etc. Capital stock, $10,000, with privilege of increasing to $250,000. Incorporators: M. J. Mulvihill, S. R. Hughes and M. D. Landau.

The Rockford Electric Lighting Company, Rockford, Ill. Capital stock, $6,000. Incorporators: C. S. Mauk, A. G. Stewart, D. O. Kuder, F. M. Kirby, J. D. Wagers and W. T. Palmer.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED NOVEMBER 29, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

614,875. Trolley for Electric Cars. Hosea W. Libbey, Boston, Mass. Filed Jan. 11, 1898.

614,941. Trolley Device. James C. Fernald, Philadelphia, Pa., assignor to Joseph A. Smith and John H. Canavan, same place. Filed April 19, 1898.

615,176. Electric Railway. Hermann T. Hillischer, Vienna, Austria-Hungary. Filed July 8, 1898.

ELECTRICAL MACHINERY AND APPARATUS.

614,914. Mechanism for Controlling Electric Circuits. George H. Whittingham, Baltimore, Md. Filed April 5, 1898.

614,927. Process of and Apparatus for Separating Metals and By-Products from Ores by Electricity. George D. Burton, Boston, Mass. Filed Jan. 25, 1897.

614,930. Process of and Apparatus for Separating Metals from Ores by Electricity. George D. Burton, Boston, Mass. Original application filed Jan. 25, 1897. Divided and this application filed April 11, 1898.

614,964. Dynamo-Electric Machinery. Joseph S. Lewis and Felix J. Howitt, Manchester, England, assignors to the P. R. Jackson & Company, Limited, same place. Filed April 12, 1898.

TELEPHONE AND TELEGRAPH APPARATUS.

614,946. Telephonic Microphone. William D. Gharky, Philadelphia, Pa., assignor to George F. Payne, same place. Filed Dec. 20, 1897.

MISCELLANEOUS.

614,839. Method of Forming Electrical Connections. William B. Cleveland, Cleveland, O. Filed May 9, 1898.

614,882. Junction-Box. Thomas J. Murphy, New York City. Filed April 22, 1895. Renewed Dec. 31, 1897.

614,928. Process of Tempering Metal. George D. Burton, Boston, Mass. Filed March 13, 1897.

614,929. Process of Tanning Hides or Skins of Animals. George D. Burton, Boston, Mass., assignor to the United States Electrical Leather Process Company of Maine. Filed April 5, 1898.

614,982. Automatic Time Electric-Circuit Switch. Frederic Richard, Boston, Mass., assignor to the Universal Electric Clock Company, same place. Filed Oct. 30, 1897.

614,995. Underground Conduit for Electrical Conductors. Charles H. Sewall, Chicago, Ill. Filed March 2, 1898.

615,057. Electromechanical Striking Mechanism. Clarence E. Beach and Herman W. Doughty, Binghamton, N. Y., assignors to the Star Electric Company of New York. Filed Sept. 8, 1896.

615,136. Electric Metal-Heating Process. George D. Burton, Boston, Mass. Filed Aug. 21, 1893.

615,142. Signaling. John P. Coleman, Edgewood Park, Pa., assignor to the Union Switch & Signal Company, Swissvale, Pa. Filed Jan. 3, 1898.

615,172. Primary Battery. Henry K. Hess, Philadelphia, Pa. Filed Feb. 2, 1898.

615,188. Electric Safety Device. John F. Kelly, Pittsfield, Mass. Filed April 14, 1898.

615,209. Electrical Hinge-Contact. Channing Baxter, New York City, assignor to Albert S. De Veau, Mount Vernon, N. Y. Filed Nov. 21, 1895. Renewed Jan. 17, 1898.

DESIGN.

29,741. Third-Rail Insulator. Edward M. Hewlett, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Nov. 7, 1898.

TELEPHONE AND TELEGRAPH.

Canvassing for the New Telephone Company in New York.

The People's Telephone Corporation of New York is meeting with immediate success in getting subscribers in the Borough of Manhattan, the canvassers having in a few days obtained the names of 6 000 or 7,000 telephone users. In fact nearly every business man who has been called on has cheerfully added his name to the fast increasing list, apparently glad of the opportunity to help along a movement that promises telephone service at reasonable rates as compared with the exorbitant charges of the New York Telephone Company. The inducements offered by the new company in its published circular are:

1. A superior system, rapid service, new instruments and first-class modern equipment throughout.
2. A reduction from $240 to $100 for unlimited service, with 100 coupons *free*, good at any pay station.
3. A reduction from $90 for 600 calls to $40 for 400 calls, with additional calls as low as 4 cents each.
4. An arrangement with message service subscribers by which they receive a liberal division of pay station tolls.
5. Private exchanges of 5 or more instruments at a rate message as low as 2 cents per call.
6. A private line residence service as low as $30 per year.
7. A group-line residence service, unlimited calls, at $1 per month.
8. No charge for service until 10,000 subscribers are connected.
9. A rebate for all interruptions exceeding 48 hours.
10. We are willing to guarantee above prices for 5 years, and permit cancellation without liability on most liberal conditions.

The councils' electrical committee, Philadelphia, on the 1st inst. agreed to report favorably to councils the ordinance to amend the ordinance granting privileges to the Standard Telephone Company. The principal "amendments" to the bill, which was assumed to have become defunct through failure to comply with its provisions within the specified time, give the company the right to erect wires "over and across" the streets of the city, to purchase or lease conduits belonging to the city or other corporations, to mortgage its property and franchises to secure its bonds, and extending to four years the time in which it must be prepared to furnish 2,000 telephones to subscribers. Regarding the proposed amendments, City Solicitor Kinsey, at the request of the committee, gave an opinion, in which he says that to extend the time as proposed "would substantially effect the release of the company from the $100,000 penalty incurred by having heretofore broken a condition of its bond."

On the 28th ult. the committee on public improvements of the Boston Board of Aldermen reported favorably the petition of the new Massachusetts Telephone & Telegraph Company for the right to enter certain streets in Boston and to operate and maintain a system of conduits, etc., in connection with their telephone system. On the same day a motion was made in the board of aldermen to suspend the rules that the order might be placed upon its passage, but the motion was defeated and the order went over under the rules. The petition, however, is likely to be granted. The incorporators of the company are: Zephaniah S. Holbrook of Cambridge, Wilbur F. Lakin of Quincy, Fred A. Spear of Lowell, Paul Faver of Boston and Silas P. Chase of Reading, Mass.

The Memphis *Scimiter* says litigation against the Cumberland Telephone & Telegraph Company in Memphis is piling up from day to day. The aim in all or nearly all the cases is to reduce the cost of telephone service in Memphis, on the ground, primarily, that lower rates are being given by the company in other parts of the State. On the 28th ult. a bill was filed in the Circuit Court the object of which is to secure damages from the company on the ground, as alleged, of illegal discrimination, under the statute which directs that there shall be no discrimination, and that the company shall in case of such discrimination forfeit $100 per day to the person so discriminated against. The complainants are Ralph Wormley & Co., Louis Woods, Peter Anderson and the Woods-Chickasaw Manufacturing Co.

A telephone company in which Armour, Swift and Nelson Morris are interested has been incorporated to build and operate an independent telegraph and telephone line to connect all their packing houses in the West with their Chicago houses. The proposed line is to connect East St. Louis, Omaha, Sioux City, St. Joseph and Kansas City. The company, which will use the Schomberg system, is offering for sale $500,000 of gold bonds. It will transact a general telegraph and telephone business.

A meeting of independent telephone men was held recently at Glasgow, Mo. The meeting was called by W. N. Wicks, president of the Glasgow system, and the object as stated, was "for mutual protection and development of the interests of all local independent and co-operative telephone companies in Missouri." About twenty-two exchanges were represented, including one from St. Louis. After discussing various plans for combining the systems, the members adjourned to meet at St. Louis on December 27, and in the meantime each independent exchange will be communicated with and invited to send a representative for the purpose of forming a permanent organization.

Attorney Oscar T. Martin on behalf of I. Ward Freye, Charles H. Pierce, E. C. Guin, Robert Gotwald and Robert Mills of Springfield, O., and others, on the 1st inst. applied to the board of public affairs of Springfield for a franchise for a telephone system in that city controlled by a local company with a capital of $50,000, to be known as the Springfield Union Telephone Company. The Central Union Telephone Company, already operating an exchange in Springfield, is offering strong opposition to the new concern, and has asked for permission to put in a conduit underground system.

The telephone fight in Windsor, Can., which lasted for several months, has ended in a victory for the Bell company, to whom the council has granted a five years exclusive franchise. The terms of the franchise are: For business offices, for local service, $25, residence $20, with Detroit service $15 extra. No extra charge is made for Detroit service for residences if the subscriber has Detroit connections at his business office. In consideration for the exclusive right, the city receives from the company $500 annually and the use of three 'phones free.

The Kansas Telephone & Electrical Company is building a line into Cherryvale, Kan., and will establish an exchange there connecting with over forty other towns and cities, including the lead and coal district of eastern Kansas and southwest Missouri, Pittsburg, Joplin, Fort Scott, Carthage, Webb City, Galena, etc. The company is composed of St. Louis people who have ample capital.

The New Orleans *Picayune* says: "By the 1st of January or thereabouts, the people of New Orleans will be able to talk by 'phone to the people of St. Louis. It is just within the bounds of a possibility, too, that by that time there will be some lightning like changes brought about in the local 'phone world, changes which may involve the absorption of various local 'phone interests."

The Worcester County Telephone Company is being organized at Snow Hill, Md., by Dr. George W. Bishop, Clayton J. Purnell, John P. Moore, Thomas M. Purnell, and others.

New Companies Incorporated.

The Rocket River Telephone Company, Potsdam, N. Y. Capital stock, $6,000. Incorporators: J. A. Crawford, M. S. Crawford and Fred C. Ward.

The Ohio County Telephone Company has filed articles of incorporation at Frankfort, Ky. Capital stock, $500. Incorporators: J. F. Cooper, T. J. Smith and C. C. Baird.

The Citizens' Telephone Company, West Unity, Ohio Capital stock, $5,000. Incorporators: James H. Miller, Leland B. Kent, Leon P. Charpist, Charles L. Arnold, W. M. Denman.

The Manhattan Microphone Company, Jersey City, N. J.—to make, buy and deal in microphones, telephones, etc. Capital stock, $100,000. Incorporators: John H. Maugham, Yonkers, N. Y.; Theodore J. Mitchell, New York City; Thomas A. Hutchins, Englewood, N. J.

The St. Peter Telephone Company, St. Peter, Minn.—to construct and operate a telephone exchange and telephone lines in St. Peter. Authorized capital, $10,000. Incorporators: H. P. Proctor, Augustus Proctor, Frank A. Chase, J. H. Chase, Viroqua, Wis.; Walter S. Proctor, St. Peter.

The Isle of Wight Telephone & Telegraph Company, Smithfield, Va.—to do a general telephone and telegraph business. Authorized capital, $5,000. Incorporators: J. W. Thomas, J. W. Holloway, W. D. Folk, L. C. Brock, C. S. Betts, J. C. Goodrich, W. J. Edwards, Smithfield; J. U. Burgess, W. N. McAuge, Suffolk, Va.

The Massies Mills Telephone Company, Massies Mills, Nelson county, Va.—to do a telephone and telegraph business. Authorized capital, $2,000. Incorporators: W. D. Meeks, James Dickie, J. C. Bentz, M. B. Hughes, E. P. Parsons, W. H. Miller, Massies Mills; A. G. Bryant, W. M. Boyd, Bryant; R. K. Anderson, Roseland.

The New Rochelle & Westchester Telephone Company, New Rochelle, N. Y.—to operate in New York, Massachusetts, Connecticut and Rhode Island. Capital stock, $150,000. Directors: George W. Sutton and Joseph Claudet, of New Rochelle; Hennett Meyer, of New York; H. A. Conner and F. R. Kellogg, of Brooklyn, and J. H. Scofield and D. G. Whiting of Grand View, N. Y.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

Abbreviations: crt. indb., certificate of indebtedness; coll., collateral; cons., consolidated; const., construction; conv., convertible; com., common; deb., debentures; exten., extension; gen., general; g., gold; guar., guaranteed; inc., income; imp., improvement; pd., paid; pfd., preferred; mtg., mortgage; tr., trust; A., annually; S., semi-annually; Q., quarterly; A. & O., Apl. and Oct.; F. & A., Feb. and Aug.; M. & S., May and Sept.; J. & D., July and Dec.; J. & J., Jan. and June.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 12.65@12.75c.; Lake, 12.75@13c.; casting, 12.65@12.75c.

The Cleveland-Chagrin Falls Electric Railway Company has bonded its line for $300,000 and will build an extension to Warren, O., at once.

The Buffalo (N. Y.) Railway Company has declared a quarterly dividend of 1 per cent., payable December 15. Books reopen December 16.

The Philadelphia "Times" states that of the total of 135,000 shares of the Electric Storage Battery Company, 104,704 shares changed hands last month.

The underwriting syndicate of the Baltimore Consolidated Electric Light Company has the privilege of subscribing at par for 200 shares of the new company—$5 a share to be paid—for every $10,000 bonds held. There will be no bonus stock.

Receiver Jump, of the Terre Haute (Harrison) Street Railway & Electric Light Company, has filed his report for the first year of the receivership just ended. It shows a balance of $14,000 from the year's operation, but this does not cover the interest charges on the old debt.

The statement of the instrument output of the American Bell Telephone Company for the month ended November 20 was: Gross output, 35,159; returned, 15,486; net output, 19,673. For the same month in 1897 the gross output was 29,023; returned, 7,817; net output, 21,206.

Twenty-one first mortgage gold 5s of 1889 issued by the Columbus (O.) Consolidated Street Railroad have been drawn for the sinking fund, and will be paid by the Central Trust Company on and after January 1, 1899, at 110 per cent., together with the coupon maturing January 1, 1899.

The directors of the General Electric Company have declared a dividend of $17.50 on the preferred stock, payable December 22 to stockholders of record December 12. This makes the total back dividends paid $29.16⅔. On October 24 $11.66⅔ a share was distributed among the holders of preferred stock.

On January 2 the Boston Elevated Railway Company will pay to the shareholders of the preferred stock of the West End Street Railway Company a regular semi annual dividend of 4 per cent. The dates of the closing and the opening of the transfer books have not been set but they will probably be December 17 and 31 respectively.

In the calendar for the December term of the Supreme Court which will convene at Albany, N. Y., this week are nineteen cases against the Albany Railway, fourteen against the Troy City Railway Company, and three cases against the railroad in reference to the accident at Cohoes on Labor Day when a number of lives were lost.

The Chicago City Railway Company has declared a dividend of 3 per cent., payable December 31. Books close December 16 and reopen December 21. The company, it is stated, proposes to increase its stock at the January annual meeting from $12,000,000 to $14,000,000, and the stockholders will be given the right to subscribe for it at par.

The Metropolitan Street Railway Company of New York has declared a quarterly dividend of 1½ per cent., an increase of ¼ per cent. for the quarter. It is payable January 16. Books close December 28 and reopen January 17. In exactly one month the stock of the Metropolitan Company has gone up 21 points. On November 5 it closed at 164½; Monday it closed at 185½.

A very noticeable feature is the great increase in the consumption of copper in Germany as compared with England and France, this being mainly due to the development and extension of the manufacture in that country of electrical plants and appliances. In England this important and valuable branch of trade has not developed to anything like the same extent as it has done in Germany.

We learn from Philadelphia that all the machinery in the works of the General Electric Automobile Company has been installed and active operations are about to begin. Contracts amounting to $100,000 are said to have been made with the company for the new type of delivery wagon running 60 miles on two chargings at a cost of 60 cents, and 220 of the new type of physician's carriage are wanted at once.

The Edison Electric Illuminating Company of New York has decided to offer to its stockholders the privilege of subscribing at par to 9 per cent. of holdings at the time of closing the books for the next dividend. It has been suggested that the present stockholders be given an extra dividend of 1 per cent. for this year, and that a suggested increase of the quarterly rate be considered for the first quarter of the coming year. The net earnings of the company continue to show a handsome increase.

Albert H. Johnson, president of the Nassau Electric Railroad of Brooklyn, arrived at New York on the Campania on Saturday. In a published interview he states that his trip to London was undertaken in the interest of a project to establish a great trolley system in that city. He declares that he has partly succeeded in his efforts, and that modern trolley service in the largest city of the world may be only a question of a short time. The New York "News Bureau" says: "It is believed in well informed circles that Mr. Johnson's sudden recall indicates a hasty consummation of the 'deal' between the Nassau Company and the Brooklyn Rapid Transit Company."

The Consolidated Railway Company of Baltimore has decided to issue $500,000 of additional stock. This stock will be offered to the present stockholders in proportion to their holdings at par, which is $25 a share. The Consolidated Railway Company has outstanding $9,172,000, and its authorized capital is $10,000,000. It has held in the treasury $828,000, and from this the $500,000 to be issued will be taken. The object in putting out the additional stock is to secure funds to pay for the Ellicott City branch of the Columbia & Maryland Railway, which the company bought, and to meet the cost of reconstructing the line and getting it ready for operation.

The Cincinnati "Enquirer" says: "The order of court for the foreclosure of the mortgage on the Columbus Central Street Railway, which has been awaited for a long time, will probably be soon followed by the sale of the road, which will be bought in by the bondholders or by the committee representing the bondholders. There remains a few matters of minor importance to settle before this can be done, after which the $1,500,000 held in bonds on the property will be satisfied. As to what disposition is to be made of the road after the property is bought in for the bondholders cannot be stated now, though the intimation that the Columbus Street Railway is making preparation to buy it in has a good source for authority."

A Wilmington, Del., paper states that an electric railway syndicate with large capital, which contemplates building a trolley line from Philadelphia to Baltimore, has its eyes on the Wilmington & Brandywine Springs Railway, and it is understood an effort will be made to secure it or a controlling interest in the near future. The syndicate, it is understood, hopes to have a series of electric railways in operation within the next few years between Philadelphia, Wilmington and points southwest and south. If the Brandywine Springs road is acquired, the plan is to build a road running from that point to Kennett Square, Pa., and from Kennett Square to New London, and thence by a route which will touch at all the more important towns in a southerly direction, terminating in Baltimore, where it is likely that arrangements can be made for a link to Washington, and possibly further south.

ELECTRICITY.

Vol. XV. NEW YORK, DECEMBER 14, 1898. No. 23.

ELECTRICITY.

Published every Wednesday by the

ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.

Long Distance Telephone, 1081 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES, ...	$2.50
IN CLUBS OF FIVE OR MORE, ...	2.00
FOREIGN COUNTRIES, ...	4.50
SINGLE COPIES, ...	10 cents

Remit by Express, Money Order, Draft, Post Office Order or Registered Letter.

ADVERTISING RATES:

As ELECTRICITY reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

EDITORIAL NOTES.

The Bell Telephone Company and Its Earnings.

The New York *Herald* has of late been discussing very thoroughly the existing telephone situation, and has given some figures showing the expenses and earnings of the American Bell Telephone Company since its inception which are exceedingly interesting to say the least.

According to the *Herald* what was known as the Bell Telephone Association was organized without capital in Boston in 1877 for the ostensible purpose of exploiting the patents granted to Alexander Graham Bell the year previous. The following year, in 1878, the so-called New England Telephone Company was organized, with a total capitalization of $200,000, only one-quarter of which represented cash, with the right to use and to authorize others to use and manufacture telephones under the patents taken out by Bell. The Bell Telephone Company was organized in Boston with Gardiner G. Hubbard as president in 1878. Of its total capitalization o $450,000 the Bell patents represented $400,000. Shortly after this, in 1879, the New England Telephone Company and the Bell Company were consolidated, taking the name of National Bell Telephone Company, having a capital stock of $850,000 paid in, which, using the *Herald's* figures, was accounted for as follows: "Patent rights to use a Bell telephone in all parts of the United States, $650 000; telephone and apparatus, $83,000; 4-10ths interest in New York district system, $35,000; Chicago district system, $45,000; Boston district system, $17,000; Lowell district system, $5,000; cash, $10,000."

In 1880, or after the suit between the Western Union Company, which had begun putting in a telephone system in New York City, and the National Bell Telephone Company had been practically won by the latter organization, the Massachusetts Legislature incorporated the American Bell Telephone Company with a capital stock of $10,000,000. Regarding this new corporation as organized the *Herald* says:

"It was to make and use and license others to use telephones, and license public and private lines and district exchanges, with a capital stock of from $1,000,000 to $10,000,000. The new company organized with $7,350,000 'paid in.' The patent rights, leases, good will, etc., of the National Bell Telephone Company were put at $6,500,000; patent rights, etc., in the Telephone Exchange in Boston, the year before worth $17,000, at $300,000, and cash, $543,100. Each share of stock in the National company was now made into six shares, and the stock in the new company almost immediately sold at par."

Dating from this period telephone companies sprang up all over the country as offshoots of the parent company. The New York Telephone Company, formerly known as the Metropolitan Telephone and Telegraph Company, is one of these, the American Bell Telephone Company owning a large portion of the stock of this corporation as well as exacting a royalty of $14 a year on each instrument in use. An idea may be gotten of the exclusive monopoly enjoyed by the American Bell Telephone Company since 1880 when it is stated that, beginning with an actual cash capital of $543,100, the gross earnings during the past eighteen years are given as $65,401,736.02, while the operating expenses during the same period were but $22,391,971.44, leaving an apparent profit of $43,009,764.58. The capital stock of the Bell Company at the present time is said to be $30,000,000, on which dividends of 18 per cent. are being paid.

The above figures would seem to prove conclusively that a charge of $240 a year for unlimited telephone service, as demanded by the local company in New York City, is exorbitant, and could be reduced by more than one-half without affecting the stability of the organization, and we are pleased to learn that another attempt is to be made at the approaching session of the New York Legislature to reduce the cost of telephone service throughout the State, with a better prospect of success apparently than at any previous session. That an entirely satisfactory measure will be adopted by an Albany Legislature can scarcely be hoped for, and it is therefore gratifying to know that there are positive indications of relief in another quarter. The new People's Telephone Company, whose canvassers are now at work throughout the city, is meeting with more encouragement even than was anticipated, and has already obtained nearly 10,000 subscribers, the number at which it promises to begin business. This company, with a paid-up capital of $5,000,000, and backed by several prominent members of the New York Board of Trade, is the first independent organization that has succeeded in gaining a foothold in the metropolis, and deserves, as it is getting, the hearty support of all persons interested in obtaining telephone service at reasonable rates.

* * *

The Street Railways of the United States.

Wonderful strides have been made in the street railway mileage of this country since 1880, the extent of which cannot be fully realized until the actual figures are placed before one. The tenth census, taken eighteen years ago, or about the time the trolley first made its appearance, showed a total street railway mileage in the United States of but 2,050 miles. With the ex-

ception of a few miles of track used for experimental purposes, animal motive power was universally used. The eleventh census, taken in 1890, showed a street railway track mileage of 8,123 miles, of which about 1,260 miles, or slightly over 15 per cent., was being operated by electricity. Of the 8,123 miles of track but 488 miles were being operated by cable, showing that even at that comparatively early period of electric traction the latter form of motive power was far more popular than traction by cable, owing undoubtedly to the fact that the cost of installing it was less. It is since 1890, however, that the great increase in the use of electricity as a motive power has taken place. A report issued by the *Street Railway Journal* in 1897 placed the total mileage of street railway in this country at 15,718 of which 13,765 miles were being operated by electricity. This showed a decrease in animal traction for the seven years preceding 1897 of 83.3 per cent. and an increase of the use of electricity of 990.7 per cent. During the same period the figures given show that cable traction had by no means become very popular, there being an increase of but 51 miles. At the present time it is estimated that the street railway mileage in this country ranges in the neighborhood of 16,300, of which probably some 15,600 miles are operated electrically, and it is thought that at the present rate of increase the close of the century will find the United States provided with a network of street railways aggregating a mileage of 20,000. The *Street Railway Review* recently published a short article bearing on the subject of street railways in which it brought out the greatness of this industry in a rather unique way. Among other things it said :

"If the street railways were to be sold the sum realized would easily pay the debt of the United States. A fair estimate of the paying passengers carried by the street railways per annum would be 2,660,000,000, and this would be increased by 50 per cent. if the transferred passengers were included."

Referring to the amount of power required to operate all the railways, it continues in the following strain :

"It is estimated that the power stations have an aggregate capacity of 525,000 HP., and consume per annum 2,300,000 tons of coal, evaporating 3,300,000,000 gallons of water. To operate the present street car equipment would require 320,000 horses, which, if harnessed two abreast, would form a solid procession extending from Chicago to Cleveland ; but to transport the passengers carried by electric cars in the slower-going horse cars would necessitate one-third more cars than now, and this would extend the line of animals to 480 miles."

The fact that Europe, with a population of about 400,000,000, has at the present time but in the neighborhood of 10,000 miles of street railways, whereas this country, with a population of one-fifth the number, is provided with over 16,000 miles, certainly speaks well for the progressiveness and energy of the people on this side of the Atlantic.

* * *

Limited Use of the Telephone in London.

Several rather sensational articles have lately appeared in England condemning the manner in which the city of London is lighted, and claiming moreover that it is the darkest capital in Europe. Whether this is so or not we leave our technical contemporaries on the other side to decide, as several of them were apparently eager to pick up the gauntlet thrown down. What however is more surprising to us, and no doubt will be to our readers, is that the Police Department of London does not make use of the telephone. According to one of our English contemporaries, there is not a police station in the whole of that great metropolis equipped with an instrument that has become almost as common and as necessary in New York City as the electric light. The absence of the 'phone in one of the most, if not the most important branches of the city's service is due, so it is alleged, not to any fault of the local telephone company, but rather to an unusual conservatism exhibited by the authorities, who have repeatedly declined to avail themselves of the privilege. In this respect the authorities of London are apparently showing the same spirit which prompted many of the banking houses to decline to have a telephone installed on their premises on the ground that "it was not quite respectable."

How the Police Department in a city such as London can get along without some speedy method of communication such as only the telephone can supply is incomprehensible to the ordinary mortal on this side of the Atlantic. In New York City in the event of a child's becoming lost or a person disappearing every police station in the department is notified to that effect by telephone in less than half an hour from the time the news is received. We should like to know how this sending out of a general alarm and description is accomplished in London. Possibly a dozen messengers are dispatched to make the rounds of all the stations, or the telegraph is made use of. As a contrast to the methods adopted in London it may come as a surprise to some of our English readers to learn that during civil and military parades in New York City booths are erected along the route the procession will follow, to enable the Chief of Police at headquarters to be constantly kept informed as to the whereabouts of the parade or told of any unusual disturbance. The Fire Department of London, in contrast to the Police Department, has telephones in all the fire houses, but the arrangement is such that when a fire call is sent by telephone it is obliged to pass through several exchanges entailing considerable loss of valuable time. This objectionable feature could be overcome by an expenditure of $50 a year for each station, but small as the cost would be it is apparently considered by the authorities wilful extravagance, and matters are left as they are. In New York arrangements have recently been completed for attaching telephones to every lamp-post having the ordinary signal box, so that communication may be established between the location of the fire and headquarters.

Under the Searchlight.

Notes and Comments on Various Topics.

AT the Merchants and Manufacturers' Board of Trade meeting at the Hoffman House in this city, on the evening of the 7th inst., the Telephone Committee, of which R. M. Walters is chairman, reported the draft of a bill to be submitted to the next session of the Legislature making it unlawful in any city of this State containing a population of 500,000 or more to charge any single telephone subscriber more than $50 a year for any number of messages less than 1,000 transmitted within the corporate limits of said city, or to charge more than 5 cents for each message in excess of 1,000 ; persons or corporations overcharging to forfeit $100, to be recovered with the excess charges by the person paying the overcharge, if action is begun within one year. The Telephone Committee is composed of R. M. Walters, chairman, Leo Schlesinger, Amasa Lyon, Charles Heckman, Francis O'Neill, Andrew Patterson and C. Du Brul.

* * *

ACCORDING to the *Times-Democrat* of New Orleans an expert in the employ of the New Orleans Telephone Company has just returned from Europe where he had an opportunity of seeing the much-talked-of telephone newspaper of Budapest, regarding which he says: "The apparatus in my room consisted of a curved steel trap to go over the head with a very small ear piece at each end. It was attached to a flexible cord about fourteen feet long and could be moved about as one chose. There was also a sort of buzzer fixed in the wall and when anything of special importance was about to be transmitted it gave out a faint hum. Over the buzzer was a printed programme for the day, including numerous musical selections and several recitations of poetry. I clapped the thing on my head immediately and was startled to hear a deep bass voice bellowing a stream of Hungarian of which I understood not a word. I had no idea it would be so loud. The speaker seemed in a tremendous hurry and his gabble was something appalling. Between communication, the machine made a clacking noise, like winding a clock—why, I could never learn. I sampled the music later and found it good. The thing was certainly great fun until the novelty wore off, and I used to take it to bed with me sometimes. They talked advertisements over it between the news items, and I was told that they got a good rate. But I have my doubts about it paying. I encountered hardly any citizens who had it in their houses. They seemed to regard it as a toy to amuse foreigners."

* * *

A CONVERSATION by telephone lasting three minutes may be carried on from Berlin to any part of Germany for twenty-five cents. For a conversation with a locality outside of the German Empire the fees range between fifty cents and one dollar. It is unnecessary to state that the above rates are considerably lower than the rates charged by the Bell monopoly for long distance service in this country.

* * *

THE would-be automobile cab drivers in Paris are obliged to take lessons in the handling of the horseless vehicles before being allowed upon the public thoroughfares. The Compagnie Generale, which owns the cabs, has, so it is said, a training track nearly a mile in extent over which the apprentices run electrical carriages until they are proficient in guiding them. The track has all the varieties of pavement that abound in Paris, with billy spots, etc., and dummies representing trucks, human beings, bicyclists and animals are distributed along the course. The apprentice dodges in and out among these until he has perfect control of himself and his vehicle.

* * *

AN officer of the New York Telephone Company is said to have a telephone directory brought from Santiago by a telephone man, a member of the Seventy-first Regiment. It shows that there are some ninety subscribers to the telephone exchange at Santiago, who paid the neat little sum of $25 each per month, or $300 a year, for the service. Has the American Bell Telephone Company already turned its attention to Cuba?

* * *

DISCOURAGING rumors are afloat regarding the prospects of the Paris Exposition of 1900. Little real progress has been made on the huge buildings, and it is thought possible the Exposition may be postponed until 1901. President Faure has visited the grounds and tried to stimulate the work. But the recent strike and difficulties between the municipality and the Government have left poor prospects of completion in time.

New Albany, Ind.—William Rothrock, proprietor of the White Cloud mills and an extensive land owner in Harrison county, this State, is interesting local capitalists in a projected electric road from Nevin, Harrison county, to Leavenworth, Crawford county, by way of White Cloud and Wyandotte Cave. The proposed line is to be thirteen miles long and extends from the Corydon branch of the Louisville & St. Louis Air-line to the Ohio river. Mr. Rothrock has a plan for supplying power for the proposed road that is novel and at the same time practicable. He proposes to place a power house at White Cloud, which is about the center of the road and on Blue river, and generate by water power the electric power for the road.

PRACTICAL POINTS IN STREET RAILWAY ENGINEERING.*

BY W. A. HARDING.

It was suggested to me that rather than present to you a paper full of data, etc., I should call your attention to the different points of interest and problems that are met with in practical street railway work, so you could start a discussion and give to each other your personal experiences.

First, I must call your attention to the fact that it is impossible to make any arbitrary laws for the conduct and management of street railway property, conditions altering under various circumstances; financial conditions, condition of travel, nature of ground, locality, speed and climatic conditions, all require different management and different problems to solve.

A road running through a very thickly populated district with good roads, etc., has the cost of operation at a minimum and can afford to spend a few thousand dollars to raise low joints, put in plenty of feed wires and keep cars well painted.

But take a road running out far into the suburbs and sparsely settled districts: to put up feed wire, keep up voltage as it ought to be and to raise low joints would bankrupt the company, and as for painting cars, it is out of the question. Many a country road runs through marshy land, making low joints the rule. The mud and water may be thrown all over the cars, and if this is of an alkaline nature you can easily see what becomes of your paint. Motors that under ordinary conditions are called water tight will here fill with water unless extreme measures are taken to provide against it.

The choosing of a suitable car and equipment in the past consisted of buying car, truck and motor, without any reference as to their suitability to each other, and car or truck would have to be rebuilt to fit. I remember a company that bought long 36 ft. combination cars, closed in the center and open, with seats at each end, having two massive four-wheel center pivot trucks, and put in two 15-HP. motors. Grades were from 3 to 12 per cent. It was only a short time before the motors were completely roasted. The company then went to the expense of cutting the body down to two-thirds size, taking one truck and lengthening out to 7 ft. and putting in two 15-HP. motors. The equipment now ran very satisfactorily, but owing to poor construction of the car body, they would "hog-back" in a very short time, necessitating constant renewals of subsills, etc.

Now what cars shall we use? Take a supposed case. For winter the public demands a five-minute schedule and the average load is from 25 to 35 people, during rush hours say 100 people per load. We do not want to haul around a large car empty half the day, so we will put on a 22 ft. car, as large as is advisable for a single truck, with two motors and large and roomy platforms; if in a cold climate, preferably vestibuled. Now if the cars should be a little crowded, the platform would always accommodate a few. When the rush comes on one or two trailers could be added for a few hours. If quickness and dispatch in unloading are not the predominating features, or too many transient passengers, a large double truck trailer car is in my mind much the better. They are easier for motormen to handle than two single truck cars, easier to ride, easier on the track joints, require one conductor in place of two and can make much faster time.

During the summer the same rule applies, except that when the climate allows, open 10-bench cars should replace the closed ones. If travel warrants it, there is still a better field for larger cars (which have side entrances) making less units.

Now in the suburban districts sometimes the smaller cars will not accommodate your passengers and yet you say you cannot afford to put on more cars. Now you can use your large cars to advantage. In fact, you can sum up the whole problem as follows: Use the largest seating capacity cars that a satisfactory schedule will warrant. For suburban travel where speed is the main point double trucks having four motors can be run faster than single trucks, with less wear and tear on equipment, track and passengers.

A word as to trucks. They should be built with the side bar in one piece, having no bolts or rivets except where the cross braces for hanging brakes are placed. Brake shoes should not be hung on links, but in such a way that they cannot kick and will take up their own wear. An average wheel base of 8 ft. is proper for single trucks when under a 22-ft. closed body, or 10-seat open bench car. Springs should be graduated to allow the car to ride easily without undue oscillation. The same rule applies to trucks for double equipment only the wheel base should be as short as the motor truck will allow, also allowing for the car to oscillate sideways.

The motors should be carefully chosen for the work to be done. A powerful motor if put under a light car hauling trailer will slip the wheels on the track and the car will not make sufficient speed; but if car body, trucks and motor are of sufficient weight to get the best traction, the train will now make faster time. The bearings of the armature should be large and fed from below with wick feed from oil, with box above to hold wool waste with additional oil in place of the usual plan of dope. Such bearings should be built outside of the motor frame and also protected by large circular disks to prevent the oil from working into the motor.

The commutator should be made of good drop forged copper bars, the diameter to be as large as possible. In G. E. 800 we use a bar $1\frac{1}{2}$ in. high. By using soft amber mica between the bars the commutator wears smooth and keeps it polished. The number of slots in the armature should be kept as low as possible, it being cheaper to make repairs when four to six coils can be put into one slot; also coils should be machine wound, a thing not possible with all our armatures now.

A motor, if carefully kept clean, the brushes properly treated and changed each night and not abused unnecessarily by the crew, will last without rewinding for from four to five years, and even longer. With proper attention to brushes, commutators of the modern type should wear not more than $\frac{1}{8}$ in. per year.

It will take too long to go into track and line construction in this paper, but I will just touch on a few points.

How are we to get the voltage raised at a distant point of the line where it is required for only a few weeks in a year? The cost to install a storage battery or booster, or to put up more wire, is all out of proportion to the returns. Take one of your dynamos with a capacity equal to the load demanded at this particular point. Change your two switches to double throw. When thrown up all connections are for running as a dynamo on the switchboard in the usual way. By throwing blades down, the + of machine is thrown onto an auxiliary bus bar and the — onto the positive main at the switchboard, making this particular dynamo in series with the station.

The equalizing switch is left open; the field wires are not altered. The dynamo is now run at whatever voltage you need, may be 200 or 300. The feeder that goes out to the point of the line where you wish voltage raised is now thrown onto this booster, as we must now call it. Again, if the feeders are properly adjusted, a switch and fuse can be put in between the circuit breakers of several sections and a whole district raised in voltage, if only for a few hours during rush time. As the station usually holds a reserve unit, there is no additional outlay or expense needed. In case of a breakdown or disabled generating unit, the boosting would be discontinued until such time as repairs were made.

Accumulator traction has greatly improved—batteries are more durable—and it certainly has a future of its own. Cars running without interference from outward sources or with each other cannot be overlooked, but I think they are not generally suitable, for the expense of changing batteries on all the outlying districts of a large system would be enormous.

A few of the disadvantages are: increased weight of car, an expensive roadbed, depreciation of the batteries and difficulty of recharging under all conditions.

I was asked the comparative cost of operating different systems of street railway, and will quote from the report of H. H. Vreeland, president of the Metropolitan, New York, the following statement:

Expense of operating horse cars......17 87 cents per mile.
Expense of operating cable cars...16.42 " "
Expense of operating electric cars..10.23 " "

In each case conditions were equally favorable for the system used.

* Read before the Chicago Electrical Association, Dec. 2, 1898.

ELECTRIC TRAMWAYS OF MONACO.*

The electric tramway recently installed at Monaco bears a superficial resemblance to the Claret and Vuilleumier surface contact system which has been employed to some extent in Paris, where it has not proved entirely unobjectionable. In the system used at Monte Carlo there are contact studs, but there is an absence of complexity in the working parts which constitutes an advance on several other systems that have been more or less discussed. It will be readily understood that the authorities of the principality would not adopt any method of traction which might conceivably detract from the appearance of the streets. They maintained that the demand for a tramway was by no means exigent, and unless some system could be devised that would in no way interfere with the appearance of the roads they were averse to a tramway.

In these circumstances a system was proposed which has now been constructed and which presents no conspicuous features in the roadway besides the ordinary traction rails. The contact studs, to which reference will be made in due course, are placed between the rails, but they present little obstruction.

The site of the tramway is, perhaps as well known as that of any other in Europe, and probably no other can surpass it in charm of scenery. Every visitor to the Riviera is familiar with the picturesque citadel of Monaco, the capital of the little principality that includes besides the city a strip of coast about nine miles in length, which is flanked close in shore by the French province of the Maritime Alps. The rock-crowned heights behind the terraced streets, the blue stretches of the Mediterranean, the sinuous indentations of innumerable bays that form the varied shore line, and the brilliant sunshine of southern France compose a picture that ought to make the fortune of any tramway syndicate which was fortunate enough to secure the requisite concession. Some idea of the situation of the tramway may be gathered from the accompanying illustrations. The first view includes practically the whole route. At the railway station near the base of the promontory on which stands the citadel of Monaco, is the western terminus of the tramway, while beyond the next point the towers of the Casino at Monte Carlo can be faintly traced. The route follows the shore-line closely, and in the second illustration a car appears ascending the Avenue de Monte Carlo, the Citadel of Monaco appearing in the background at the right. The main line extends beyond the station to the boundary of the principality at Saint-Roman. The total length of the route from Monaco to the Casino is about

* Abstract from the *Railway World*, London.

three miles. It is intended to construct a line from the railway station at Monaco to the town proper, and ultimately the system will have a total length of about six miles, but this will form only a first stage in an important line of electric railways to connect Monte Carlo and Mentone via Nice. This will enable travelers to enjoy the incomparable panorama which the shore presents without the interruption of the numerous tunnels through which the existing railway passes.

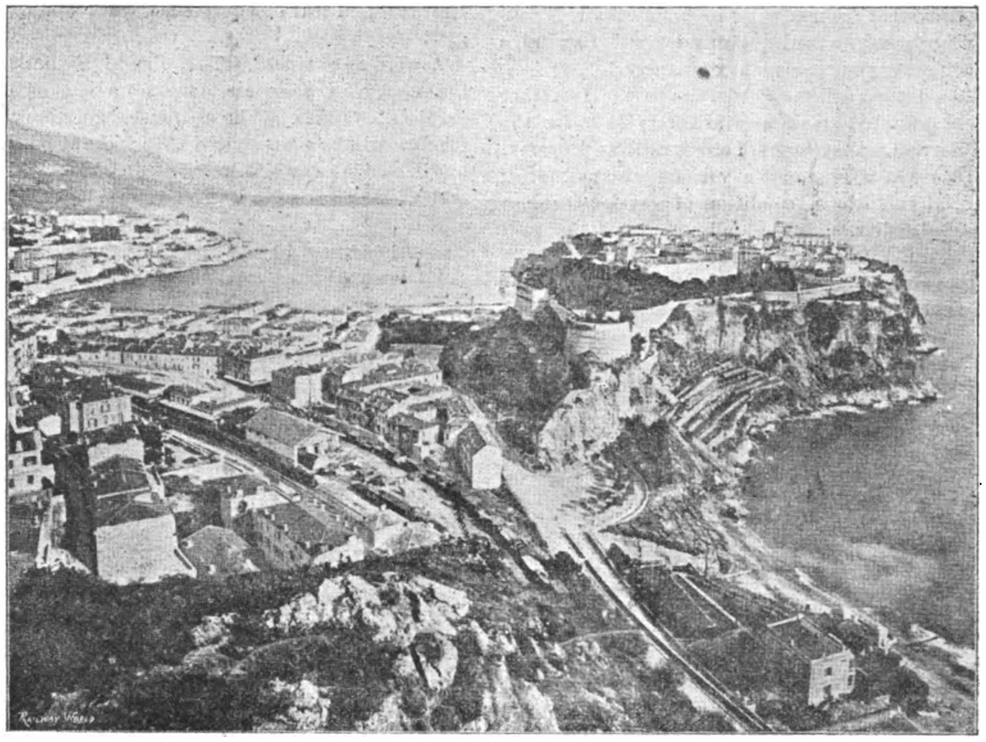
The permanent way of the lines now constructed consists of grooved girder rails weighing about 73 lbs. per yard, spiked to transverse wood sleepers and tied by rods at the usual interval. The sleepers are covered with the road metal to the level of the rails, which serve for the return circuit as in the overhead trolley system, and are therefore thoroughly bonded. The gauge of the track is one meter. The gradients are numerous and varying. A view of the principal one on the Avenue de Monte Carlo is shown below; its length is 1,320 ft., and the rise is 1 in 12.5, occasionally increasing to 1 in 11. There are specially sharp curves, 66 ft. being the shortest radius which it was necessary to use.

SYSTEM OF TRANSMISSION.

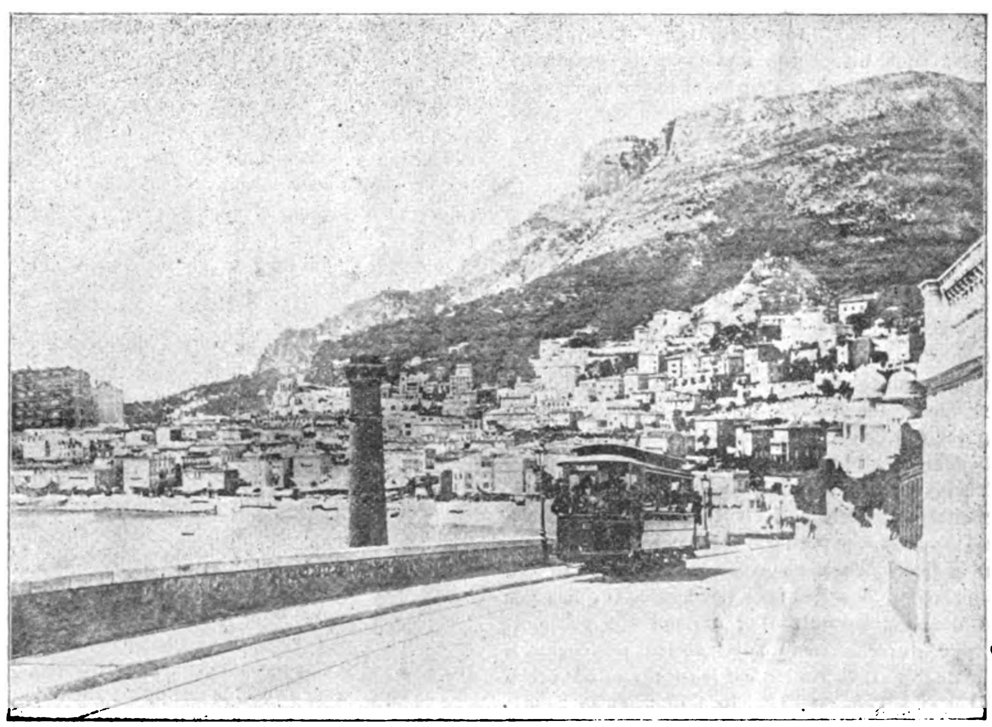
Current is conveyed to the cars by underground cables, and contact studs, which are charged only when the car is passing over them and they are being pressed by the contact shoes that are placed under each car. The contact studs are disposed alternately in two parallel lines, each placed at a distance of about 10 in. from the nearest rail. These studs consist of a contact piece, shaped like a mushroom, with a shaft or stem screwed into an iron cylinder. In the lower part of the same cylinder, which is threaded throughout its whole length, there is previously screwed a piece of copper, presenting an interior cylindrical orifice in which is soldered the end of the cable which serves to conduct the current. The whole is solidly fixed in a block of wood which is itself encased in a cast iron box. In the negative or low potential series, these iron boxes, which completely surround the wood boxes, have an exterior base forming a single body with them. They serve as an electric screen, and they are connected to the traction rails by a copper cable. When the boxes are placed in position they are fixed to the transverse sleepers by means of long screws passing through the exterior base. In the other, or high potential series, the boxes are unprovided with an exterior base, and do not entirely fill the wooden box. They are secured interiorly to the sleepers. This latter series of boxes transmits the current from the feeders to the motors. By suppressing the exterior base of the iron box the distance is increased between the metallic part of the stud and the rail, and the loss that might be produced by leakage is diminished. The cables which are inserted in the lower part of the studs connect them electrically to commutators or automatic switches placed in small pits constructed at intervals along the line. These pits have a depth of 6 ft. 6 in., a length of 8 ft. 6½ in., and a width of 3 ft. 6 in. They contain twenty-two switches arranged in two horizontal series, six upon each of the smaller walls, ten upon one of the larger. The fourth side is left clear so that inspection of the apparatus may easily be made. The various apparatus are affixed to boards of creosoted pitch pine secured by corner irons fastened to the walls of the pit, which is itself covered with a coating of cement.

Above the free side there is a manhole covered with an iron lid, beneath which there is another cover, closed firmly by bolts, which forms a hermetical joint, designed to prevent the entrance of water into the pit.

The switches consist of an electro-magnetic bobbin, in which moves a bar of soft iron that actuates an iron plate. This plate or armature carries three small pieces of carbon electrically united by the plate itself. When this armature is raised these carbons coincide with three copper contacts (placed under the bobbin) which are themselves insulated from each other. One of the contacts is permanently united to the principal feeder, the other two are connected respectively to the cables communicating with two successive contact studs of the high potential series, and on the other hand with contacts corresponding to the neighboring switches. As soon as the bobbin is demagnetized the iron plate falls and the studs, which when in contact with it are at a potential of 500 volts, naturally fall out of circuit. A magnetic blow-out placed beside the switch prevents the formation of an arc when the iron plate in falling cuts off the current.



BIRDSEYE VIEW OF THE ROUTE OF THE MONACO ELECTRIC TRAMWAYS.

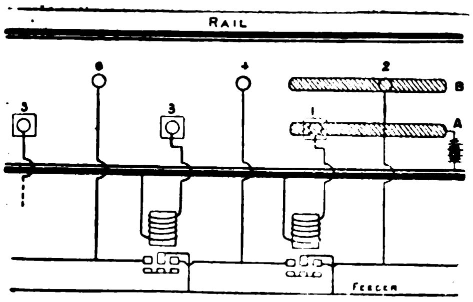


CAR ASCENDING THE AVENUE DE MONTE CARLO.

As in other contact systems, the current is taken from the studs by parallel contact bars placed underneath the cars. In this case these bars are two in number, and they are supported by pieces of iron fixed to the motors. A double system of levers actuated by a self-regulating spring is said to give a sufficient pressure of the shoe upon the contact stud without causing the shoe to rub along the surface of the street. The tops of the oval heads of the studs project above the surface about .55 in.

Referring now to the sketch which gives a diagrammatic view of the circuits, the operation of the system can be explained in a few words. Contact studs, numbered respectively 1, 3 and 5, belong to the negative or return series, while numbers 2, 4 and 6 represent the high potential or feeder series. In order to put the car, of which the contact bars A and B are placed as shown in the figure, in motion, a small battery in the car is put in circuit with bar A, the other pole being constantly connected to earth through the car wheel and track rails. As soon as the current traverses the bar A, the stud 1 conducts it to an electro-magnet, and thus to the return circuit, which is formed by the rails in the usual manner. While the current continues the magnet is energized and attracts and holds the plate of iron, putting it in the feeder circuit and making connection with the studs numbered 2 and 4.

The current from the main feeder thus passes through the stud 2, and by means of the iron contact bar B to the motors, the return current passing by the stud 1 and the magnet to the rails. The battery is rendered at once useless, as the return current serves to keep the magnet energized, and so to keep the feeder circuit open while the contact bar A is over stud 1. As soon as bar A touches stud 3 the return current passes by a new circuit and traverses the coil of the second magnet. At the same moment a plate is drawn to that magnet and studs 4 and 6 are connected to the feeder. Inversely, as soon as bar A has left stud 1 that magnet is deenergized, and stud 2 is out out of the circuit, stud 4



DIAGRAMMATIC VIEW OF CIRCUITS

being still fed by the second switch. The studs are placed at intervals of 16 ft., and each pit serves to work 45 studs, extending over a length of 281 ft.

ROLLING STOCK.

The carriages are of a novel type. They were built especially for this service, and they are mounted on Brill 21-E trucks. The truck is of meter gauge and its wheel base measures 6 ft. 6 in. The wheels are 33 in. in diameter. On each axle is mounted a Thomson-Houston motor (type G. E. 53). The cars are fitted with electro-magnetic brakes in addition to the ordinary hand brakes, and there are two sand boxes.

The cars, which have accommodation for thirty-six passengers, twenty-four inside and six on each platform, have two compartments, for first and second class passengers respectively. The extreme length of the car over the dashboard is 27 ft. 6 in., the platforms being 4 ft. 2 in. long. The body is thus 19 ft. 2 in. in length. The width of the body is 6 ft. 1¾ in. at the floor sills and 6 ft. 8½ in. over the posts. Each compartment accommodates twelve persons, the seats being placed transversely, those on one side of the aisle being single seats. In the first-class compartments the seats are upholstered and covered with olive plush, and in the second class they are of cherry wood laths with high backs. The windows have cherry sashes and are fitted with spring roller blinds. The platforms have folding gates. The exterior of the car is painted a dark olive green with the coat-of-arms of the principality in the center of the waist panel.

Opening of the Dusseldorf-Crefeld Light Railway.

The London *Electrician*, quoting from the *Electrotechnische Zeitschrift*, gives the following particulars of the official opening on November 10 of the light railway between Düsseldorf and Crefeld and the new bridge built for it across the Rhine near Düsseldorf. The line, which has been built by Messrs. Siemens & Halske, has a total length of 14 miles, the length of the track being 18½ miles. The steepest gradient is only 2.5 per cent. As it will to a certain extent carry trucks between private sidings and the State railways it has been built standard gauge. Two sizes of motor cars are used, those for local traffic being fitted with two motors of 20 HP., while those for long distance work contain two 35 HP. motors. A power station of 360 kilowatt capacity furnishes current to the overhead line, and an accumulator sub-station has also been erected containing two batteries each of 118.8 kilowatt capacity. A speed of 25 miles an hour will be attained on some sections of the line.

PROF. GEORGE FORBES ON LONG DISTANCE TRANSMISSION OF ELECTRIC POWER.

Prof. George Forbes, F. R. S., M. I. C. E., who needs no introduction to American electrical engineers—especially considering his connection with the Niagara Falls works—has just been reading an interesting paper before the Society of Arts, London, on the subject of "Long Distance Transmission of Electric Power." The following is a report of the most important portions of the paper :

This subject [long distance transmission] has been much talked about, but little has been done, and even at this moment there are few people who realize what a vast field there is in this way for investment of capital on a sound commercial basis. Hitherto people have been appalled at the capital required for copper conductors. In the present paper I bring forward nothing new. I use the methods which have been used for shorter distances, and I do not propose to suggest the use of electric pressures which have hitherto been considered unattainable. In all cases it is assumed that the power is generated by a waterfall driving a turbine which rotates a dynamo machine. The electric pressure may be raised by transformers. It is then carried by bare copper conductors to a point perhaps hundreds of miles distant; the pressure may there be lowered. The current is then passed through an electric motor which drives stamps, or mills, or pumps, or hoists, etc. In this paper there is no time to devote to consideration of different systems or kinds of machinery, or of replacing copper by aluminum. It is a plain unvarnished tale of the ordinary methods in use extended to somewhat greater distances.

During the progress of the electric works at Niagara Falls, attention was much given to the economic problems involved in the transmission of electric energy to a distance. But in that case clearly the following financial conclusion ruled the conditions : It is always more profitable to bring the works requiring power to the electric source of power than to transmit the power to a distance *provided*—and in most schemes this is a large if—you can find consumers to come to your locality. At Niagara this seemed likely, and consequently distance transmission beyond 25 miles was considered undesirable in the first instance.

I am here as an advocate of very distant transmission in all cases where it pays, and I know that it will yield a splendid return in many cases that have come under my notice. In all cases it would pay if there were a demand for the power at suitably high rates.

Of all industries to which it is applicable, gold-mining is the one which has come mostly to my notice as wanting a continuous supply of power day and night, and often without any economical means of getting it except by electric transmission. In these cases it will often be profitable to the gold-miner to pay a high price for his power.

The distances with which I have had to deal go up to 250 miles in India, New Zealand and Egypt, and if the Rhodesia mines show generally such returns as the Geelong and Selukwe mines have done, I have shown that the power of the Victoria Falls may be economically transmitted in some cases to 500 miles and pay well.

Waterfalls will be valuable assets in the future. At present the difficulty of using their power generally lies in the fact that there is no demand for power in the neighborhood. Some industries, like those connected with aluminum and carbide of calcium, are ready to go considerably out of their way to plant their works near a source of power. There are not many such industries. . . .

I will now speak to the financiers who may think of taking up electric transmission.

TO FINANCIAL MEN.

The financiers in the city of London or elsewhere who enable the projects of engineers to be carried out, even when they possess no technical knowledge have a wonderful instinct by which they know the important points to be certain about before supporting a scheme with their money. Erroneous opinions on engineering points may for a time prevail, but not for long.

Many examples of this insight might be given, but let us confine the matter to long distance electric transmission. I will give you four objections which are always raised :

1. "Has electric power ever been carried to such distances as you speak of?" The answer is "No." But electrical practice is advancing by strides. In 1882, at Munich, Marcel Desprez earned great credit for transmitting electric power 35 miles and getting a return of 25 per cent. But, in 1891, 70 per cent. efficiency was obtained between Lauffen and Frankfort, the distance being 108 miles.

2. "Are you sure that no new electric difficulties will arise when you go beyond the 108 miles of transmission, which has been accomplished ?" The answer is, "We are sure of this from the tests made at Frankfort." [Only one difference between short transmissions and the 108 miles from Lauffen to Frankfort was found to exist and it had been anticipated by me in preparing the Niagara works. In 1892, I laid it down as essential for the works at Niagara, in order to be prepared for long distance work and for other reasons, that the frequency of the alternations should be as low as the construction of a good dynamo would warrant. In 1894, the tests at Lauffen-Frankfort were published, showing that without this low frequency no good efficiency could be got from the long distance power transmission owing to the great self-induction of the line.]

3. The financier again asks, "Are not the losses by leakage on a long line insurmountable?" The answer is, "There is hardly any loss by leakage. There is loss of power used up only in warming the transmission lines." But this loss can be calculated accurately, and in those cases where the wasted power costs little enough, we are glad enough to waste it if it saves copper, which is the great cost.

4. The business man then asks, "Well, but if you allow a great loss of current in transmission, do you not require an enormous quantity of copper to carry the extra current which you have to generate?" The answer is that this is perfectly true if you allow the losses to be too great, but up to a loss of 50 per cent. on the transmission line you are always saving copper by having greater losses on the way. In fact, every engineer who has made a serious study of long distance transmission will bear me out when I say that the cases in which electric transmission will pay can be clearly differentiated from those which will not pay, and the whole question is principally one of £ s. d. Also, that all engineers will agree as to what is the principal item of expenditure, viz., the cost of copper under the conditions of existing practice. Improvements may reduce this cost, but cannot increase it; hence the financier may be sure of the data of expense, and if he can be equally well assured of the data of revenue he has before him everything required for forming a sound judgment. Let us take three cases.

1. Suppose a water-power is utilized for distant transmission of 200 miles to a gold mine where transport is difficult and the ore rich. Suppose that the miners are ready to pay £100 per annum for each horse-power delivered continuously to the stamps, etc.—I am taking what may be looked on by some as an extreme case, but there are many such places in the world—suppose that it is a gold field employing only 1,000 horse-power continuously, the gross income is then £100,000 per annum. This is a large sum, and will warrant a very large capital expenditure.

Now if it is a case in which 20,000 volts of electric pressure may be used, less than 900 tons of copper is required, after 50 per cent. has been added for self-induction, giving an inefficiency (inverse of effi-

ciency) of only 1.4. Thus 1,400 horse-power will have to be generated at the waterfall end of the transmission line for 1,000 horse-power delivered at the other end—the gold mine. The hydraulic and electric machinery are not likely in a favorable case, even with costly transport, to exceed £14,000. The working expenses are small, and clearly the great thing to be considered is the cost of copper. This might amount to £80 per ton of copper laid or £72,000. Very likely the whole cost would be under £100,000, which with a maximum possible annual expenditure of £20,000 would produce a revenue of £80,000 per annum or 80 per cent. I am sure that actual cases exist where this might be done.

2. If the distance were 400 miles, all other things remaining the same, the only serious difference is in the cost of copper, which rises to £288,000; and taking £32,000 for the other expenses, the capital expenditure is £320,000. If the annual expenses were £20,000, which seems impossible, the net income is £80,000 or 25 per cent.

3. Suppose the distance still 400 miles and all other things remaining the same, but only £50 being paid per annum for the horse-power; here we have still £320,000 of capital expenditure, and a net income of £30,000 for 1,000 horse-power delivered or 9 per cent.

Of course, it is understood that while cases can occur where these figures apply each case must be examined on its merits.

Looking at the last case quoted, the delivery of 1,000 horse-power at 400 miles, using 20,000 volts (or 200 miles with 10,000 volts), the financier would say 9 per cent. was not good enough for such a venture. I will now show how he may get 40 per cent., using the same machinery, the same copper and the same annual expenses. This leads me to say a few words to the great copper companies.

TO COPPER MERCHANTS.

I have now the pleasure to lay before you a simple financial transaction which copper merchants or others would willingly make, and which may avoid the huge capital hitherto required by those who would transmit the power, and will increase the dividends on money spent in the transmission. What I propose is to divide the capital account into two parts—ordinary stock which may be looked upon as speculative, and bonds on the copper which would be as sound an investment as could be desired.

Taking the last case mentioned, the capital charges are:

3,600 tons of copper at the extreme value of £75 a ton	£270,000
Putting in place at £5 a ton	18,000
Hydraulic and electric machinery, etc.	32,000
Total capital required	£320,000

Most of this capital is required for copper, which may be taken away if the company fails, and is an absolutely safe security.

The value of the copper is	£270,000
Cost of removal (uncalled capital)	18,000

On the £270,000 a mortgage may be raised, and 4 per cent. ought to cover the chances of a change of market value. Thus we have—

Annual payment on mortgage	£10,800

All we have done is to raise a mortgage on the best possible security. This might be done by the copper companies, who often have too much material in stock not paying interest, or the money could easily be obtained from independent capitalists. Let us now see what difference this has made upon the balance-sheet. The capital charges are:

Putting copper in place		£18,000
Hydraulic and electric machinery		32,000
		£50,000
Annual gross receipts—1,000 horse-power at £50		£50,000
Less annual expenses	£20,000	
Mortgage on copper	10,800	
		30,800
Annual net receipts		£19,200

or almost 40 per cent.

By this simple transaction we reduce the total capital required by the transmitters of power from £320,000 to £50,000 for 1,000 horse-power delivered, and we have increased the rate of interest from 9 per cent. to 40 per cent., which ought to satisfy most people.

This scheme I have laid before the manager of one of our largest copper companies, and he entirely approved of the general lines.

Before leaving this part of the subject, I wish to make it quite clear that none of the figures which I have given up to the present must be taken as applicable to every case that may arise; the cost of developing the power at a waterfall depends so much upon the height of the fall, accessibility, etc., that no kind of an idea can be given of the cost without some data to go upon. The costs used in the above calculation are over the mark for the most favorable cases and the cost of copper is also too high. Another factor is the size of the works. The larger the scale the smaller is the relative cost of works.

All that I have tried to make clear is that if there be a large and continuous demand for the power, and if the value of the mechanical power to the gold miner or others is great, the distance to which it can be transmitted with financial success is not limited to one or two hundred miles.

TO ENGINEERS.

Up to the present date financial men have not realized the value of long distance transmission. Engineers, too, have been so much engaged with electric lighting and traction that few have devoted much time to its study. The last nine years of my life have been devoted almost entirely to electric transmission and the last four years to very distant transmission.

At present there exist no printed tables for facilitating calculations, such as civil engineers possess in other branches of the profession. In the case of electric transmission, every engineer must prepare his own sets of tables and curves to work from. I have been compelled to work these out for myself in various units. In England we use miles, tons and pounds sterling. In America the units are 1,000 feet, the pound avoirdupois and the dollar. In Egypt the metric system prevails. The flow of water, too, must be taken in cubic feet per minute, gallons per day, meters per second, the Californian "miner's inch," or the New Zealander's unit, which is called a "head."

You will believe then that I possess a mass of tables and curves, and these might be worth publishing if the time had arrived, which is not perhaps yet. During these years, however, my methods have become so simplified that I venture to bring to your notice one curve in relation to the one special question of efficiency and cost of transmission lines. It is so simple in its present form through a gradual evolution that I cannot help thinking that it may be of use to others.

In transmission schemes the cost of copper becomes so all-important, when dealing with long distances, that it helps more than I can tell you to have simple means for estimating even roughly the cost and efficiency under various conditions.

I feel some diffidence in laying before you these methods because there is nothing new in the results, and all the results can be obtained by the ordinary methods. They have, however, been invaluable to myself. These methods are particularly useful for getting out preliminary estimates quickly.

Here let me say that in all preliminary work on the cost of long conductor lines I never take notice of the resistance of the conductor, nor of the value of the current. I deal only with the current density and loss of volts. It is the same thing under a different name. But it is what you want.

Again, I never use in calculations for my own use the efficiency of the conductor system. It is far more convenient to use the inefficiency or the reciprocal of the efficiency, which is also the horse-power put into the generating end of the line to deliver one horse-power at the other end.

I give you these suggestions for what they may be worth as the result of long experience.

I suppose everyone present is aware of the fact that if you had a case where the power cost absolutely nothing, you would use the least copper and have the cheapest arrangement, with an inefficiency of 2, i. e., an efficiency of 50 per cent., or 2 horse-power generated for each horse-power delivered. If

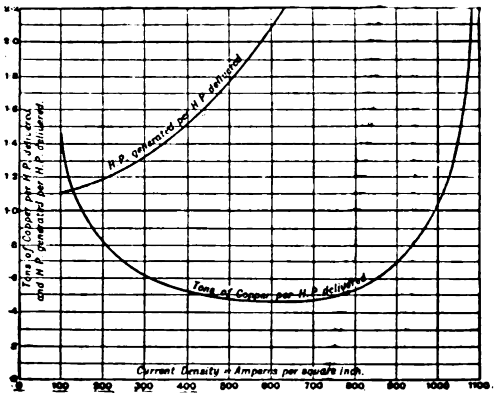


FIG. 1.

Electric Transmission Curve for 100 Miles at 10,000 Volts Continuous Current.

you make the current density either greater or less than what is required to produce this inefficiency, then you have to use more copper to deliver the same quantity of power.

This is a point which in a general way is appreciated by the business man who is not an electrician, as has been already stated.

Fig. 1 shows this very well, and a study of it is interesting. We see that the copper required to transmit 1 horse-power 100 miles at an initial pressure of 10,000 volts, with continuous current, falls with the increase of density until the efficiency is 50 per cent., and then rises. This figure shows the weight of copper required per horse-power delivered at a distance of 100 miles at 10,000 volts. It is drawn for the simplest case of continuous current, to which corrections only for temperature and sag have to be made. It is equally applicable to a single phase or two phase alternating transmission to 100 miles at 10,000 effective volts, or at 5,000 effective volts from any wire to the middle of the electric system, or to three phase transmission to 100 miles at 5,000 effective volts from any wire to the middle

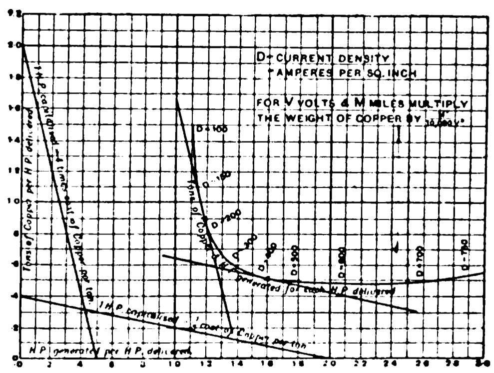

FIG. 2.

Electric Transmission Curve for 100 Miles at 10,000 Volts Continuous Current.

of the electric system. But with alternating current corrections must be made for self-induction and capacity.

The same remarks apply to the meaning of the voltage of the line in all the curves and tables referred to. They are worked out for continuous current, and for any other system the engineer must add the usual corrections.

Another curve may be drawn showing the inefficiency at each current density. This curve con-

stantly rises, i. e., the greater the current density, the greater is the inefficiency.

Now from these two curves we can deduce a third curve, which is the one which I find gives one in a few minutes all the main facts one wants for any horse-power to be delivered to any distance at any initial volts.

The curve gives the tons of copper per horse power delivered at 100 miles with 10,000 volts continuous current, in terms of the horse-power generated per horse-power delivered.

Measuring along a horizontal line you get the inefficiency, i. e., the horse-power generated for each horse-power delivered; and measuring vertically you get the corresponding tons of copper required for each horse-power delivered at a distance of 100 miles.

The curve is also marked with figures to show the current density in amperes per square inch section of copper.

I never travel a day without this curve in my pocket. This curve is correct for 100 miles and 10,000 volts or for any other case where volts equal 100 times the mile. The curve shows you, for example, that for an inefficiency of $1\frac{1}{2}$ you require a current density of 387 amperes per square inch, and .55 ton of copper. And thus current density and weight of copper per horse-power is the same whether you use 10,000 volts at 100 miles or 100 volts at one mile.

For any other volts and distances in miles, V and M, you divide the volts by the miles and get $\frac{V}{M}$; then $\frac{V}{100M} = D$, the multiplier for the current density, and $\left(\frac{V}{100M}\right)^2 = T$, the divisor, for the tons of copper per horse-power.

As an example, 15,000 volts and 300 miles. Here $D = \frac{15,000}{100 \times 300} = \frac{1}{2}$. Hence for an inefficiency as above of $1\frac{1}{2}$, the current density will be $\frac{1}{2} \times 387 = 193$. The tons of copper per horse-power will be $\frac{.55}{(\frac{1}{2})^2} = 2.20$ tons.

Now let me show another use of the curve. Suppose we capitalize the cost of running the generating station, and add to it the cost of the generating works, and divide by the horse power, we have then the capitalized value of 1 horse-power generated; I will call it for short the value of 1 horse-power generated. We also knew the cost of one ton of copper. Divide the value of the horse-power by the value of the ton of copper, and draw a line across the axes so that it cuts the axes in that ratio. Draw a line parallel to this and touching the curve. This gives you, according to Lord Kelvin's law (as modified by Ayrton and Perry), the point of maximum economy, giving directly the inefficiency, the tons of copper per horse-power and the current density. Thus on the curve two examples are shown, one where the value of 1 horse-power is four times that of a ton of copper. In this case the greatest economy is got by an inefficiency of 1.18, a current density of 180 amperes per square inch, and 0.91 tons of copper per horse-power delivered at 100 miles distance, the initial pressure being 10,000 volts.

Another example is shown on the curve where the horse power is one-fifth of the cost of a ton of copper.

The resulting values are seen directly to be: Inefficiency = 1.58; current density = 420; copper = 0.51 tons. To do this for other values of T $\left[T = \left(\frac{100M}{V}\right)^2\right]$ you must divide the value of the horse-power by T. Measure this distance vertically by the unit on the vertical scale or by fractions of these units, and measure the cost of a ton of copper horizontally by the unit on the horizontal scale or by the same fraction as before of that unit. Join the two points by a line and draw a parallel line touching the curve at the point of maximum economy.

You will see how valuable such a curve must be for obtaining the very information that an engineer requires in his first examination of any project. But we can do more than this. Divide the tons of copper per horse-power by eighteen times the distance in miles, and you get the sectional area in square inches of the conductors (go and return) per horse-power. Multiply this by the total horse-power to be delivered and you get the size of your conductors.

N. B.—Remember that this is all worked out for continuous current, and must be corrected for other systems as well as for temperature and sag.

Some people prefer to work by tables instead of by curves, so I will put down the readings of the curve which we have just been discussing. For ordinary work the following is sufficient:

Inefficiency.	Tons copper per HP.	Current density.
1.20	.86	190
1.30	.66	266
1.40	.58	330
1.50	.55	387
1.60	.51	432
1.70	.49	475
1.80	.48	510
1.90	.472	545
2.00	.470	574

In most practical cases, however, the economical inefficiency for long distance transmission lies between 1.20 and 1.50. The following table gives closer values over this range:

Inefficiency.	Tons.	Density.	Inefficiency.	Tons.	Density.
1.20	0.86	190	1.36	0.60	306
1.22	0.80	207	1.38	0.59	319
1.24	0.76	221	1.40	0.58	330
1.26	0.72	236	1.42	0.57	342
1.28	0.69	250	1.44	0.56	354
1.30	0.66	266	1.46	0.55	365
1.32	0.64	279	1.48	0.54	376
1.34	0.62	292	1.50	0.53	387

From either of these tables, having given the inefficiency, to get the density for any volts and distance, multiply the above value by $\frac{V}{100M}$, and to get the tons of copper divide the above value by $\left(\frac{V}{100M}\right)^2$

This little table enables us then, with a very simple piece of arithmetic, to get the result for any case that may arise, sufficiently close.

But in actual practice I find it far more useful to have the table extended in such a way that an approximate result may be arrived at without any calculation.

Three tables are here given. The first gives a reference letter for any volts and distance. In the second and third tables the results we want are found under that reference letter. The second table gives the tons of copper per horse-power delivered, and the third gives the current density for any inefficiency that we may select.

TABLE I.—DISTANCE OF VOLTS.

Virtual Volts between Wires.						
One or two phase..	5,000	10,000	15,000	20,000	25,000	30,000
Three phase	4,325	8,650	12,975	17,300	21,625	25,950
Distances in Miles.

Rule II.—To find the tons of copper per horse-power delivered.—Look along the row in Table II referring to the reference number, and tons of copper are there given for each inefficiency. The inefficiency being the horse-power generated to deliver the horse-power at the distant point.

Rule III.—To find the current density.—Table III gives this in amperes per square inch in the row corresponding to the reference number, and in the column corresponding to the inefficiency chosen.

Rule IV.—To find the economical conditions of working (Kelvin's law).—Divide the capitalized value of 1 HP. by the cost of one ton of copper. Divide this by 10 and call it q. In Table II look along the row corresponding to the reference letter until the difference between successive numbers is approximately q. The number at the head of that column is the economical inefficiency, the tons are also then

given, and the current density is obtained directly in Table III.

Rule V.—To find the total section (go and return) of all the transmission conductors.—Multiply the tons per horse-power by the total horse-power, and divide by 18 times the distance in miles. This is the result in square inches. Dividing this by the number of conductors gives the sectional area of each.

I trust that I have not wearied you with these arithmetical conundrums. All I can say is that I have found them of the greatest use, and I shall be very pleased if some of you do also.

I trust that all here present who are not engineers realize now that the cost of transmission of electric power to a distance is a pure question of balancing expenditure and profits. By the methods now described, or by the ordinary methods, there can be no question as to the cost of the work. The only point in fact affecting the cost which has been left to the choice of the engineer is the electric pressure to be used, and every engineer in reporting on a scheme generally gives his reasons for selecting the pressure. In old days the highest pressure for which we could get a guarantee from contractors was used. But the expense of insulation was increased so much with increase of pressure that now, as at Rheinfelden, we work to that pressure which is the most economical. Manufacturers will now guarantee any pressure if you will pay for it.

Having now determined with sufficient accuracy the cost of the works and their maintenance, annual expenses and interest on mortgage, the next thing is to see (or perhaps this ought to be the first matter attended to) what return can be obtained for the power delivered to a distance. It is then for the purely financial men to say whether the profits to be derived are worth the venture.

It has been my object to-night to put before engineers some useful rapid methods for arriving, on the ordinary lines of working, at the data for any special case of long distance transmission of power. It has also been my object to show that those who carry out such schemes do not require to be handicapped by the enormous capital which has hitherto been generally considered necessary. Incidentally it would appear that whenever gold mines exist which can afford to pay 5s. or 6s. per ton of ore milled, and if there be good water power within 400 miles of the mines, it is most probable that it will pay well to transmit the power electrically.

If I have convinced any doubters that simply in my limited experience I have found many cases where it will pay well to transmit power to distances of several hundred miles, then my purpose is served, and I shall be glad that I have brought this subject to your notice.

The Rays of the Glow-Worm.

The pale green light that shines from the so-called "glow-worm" is said to be due to the emission of X-rays. It is claimed by some that this creature is not a worm at all, but the wingless female form of a species of beetle, the *Lampyris noctiluca*, and her luminosity is supposed to afford the means of attracting the non-luminous male. Recently 300 of these insects, according to the *Revue des Sciences*, were made the subjects of experiment by enclosing for two days in a dark chamber, sheltered from all foreign lights, and placing before photographic plates screened by several thicknesses of black paper, besides plates of brass, copper, and aluminum; also a piece of cardboard, with a hole in it, was interposed between the plates and the photographic plate. On developing the latter, it was found to be blackened, except at the part opposite the hole in the cardboard. The rays of the *Lampyris*, therefore, appear to have penetrated the metal and excited luminosity in the cardboard. It was subsequently discovered, also, that when there was nothing between the sensitized plate and the "worm" the rays acted as do those from ordinary light, but in traversing cardboard and certain metals they acquired the properties of the Roentgen rays. It is suggested that possibly these creatures have the property of emitting both forms of rays.

TRANSMISSION OF POWER BY ELECTRICITY.*

(*Concluded from page 344.*)

The actual expenses during 1897 in connection with the boilers, pumps and condensers were £8,746. and include coal, carting the same and the ashes, trimming coal and stoking boilers, washing, cleaning and attending boilers, condensers and economizers, supervision, repairs, gas, sundry stores, 10 per cent. depreciation and 5 per cent. interest.

The present staff to work five return tube and two Babcock & Wilson boilers consists of one chief stoker, five stokers, one trimmer and one boy.

For the engine department the total expenses were £1,648, comprising the wages of the engine room staff and of occasional help from the yard department, supervisions, repairs, stores, 10 per cent. depreciation and 5 per cent. interest.

The engine room staff consists of three engine drivers, two dynamo attendants, and three electrical assistants, whose time is not wholly taken up with central station work.

In these charges no account is taken of the water, most of which is used in the india-rubber department before it is transferred to the boilers. The total amount spent on such water was £234 for the year 1897, and one-third, or £78, should be charged against electricity.

According to these figures the actual cost of electricity was, in 1897—

Expenses in boiler department	£1,873
Expenses in engine department	1,648
Expenses for water	78
Rent, taxes, insurance and salaries	220
1,178,286 B.T.U., total cost	£6,319

or 1.287d. per B. T. U., or 0.69d. per electrical horse power at the switchboard of the station.

For the maintenance of the cables no expenses at all were incurred, but for depreciation and interest 7½ per cent. should be charged on the capital outlay which was in round figures £3,000.

In connection with the motors the expenses were £2,063, comprising repairs, stores, labor, 10 per cent. depreciation and 5 per cent. interest.

A further charge on the motive power is the 5 per cent. loss in the conductors, and 10 per cent. loss in conversion from electrical into mechanical energy.

Taking all these figures together, we arrive at the total cost of motive power during the year 1897, viz., £9,900, or 2d. per B. T. U. at the terminals of the switchboard, and 1.7 per brake horse power per hour exerted by the motors.

It is not pretended that these results are the best obtainable; they may, however, be utilized for drawing

SOME GENERAL CONCLUSIONS

which apply to transmission of power by electricity generally.

For this purpose the total of £9 900 has to be subdivided under the heads:

A.—Standing Charges.—Depreciation, interest, payment of rates and taxes, rent, general charges and loss in conductors and conversion.

B.—Fuel.—Coal and carting the same.

C.—Labor and Supervision.—Actual wages paid in connection with boilers, engines and motors, also part of foreman's wages.

D.—Stores.—Mainly oil and waste, also water; the charge for the latter is, however, exceptionally low as explained above.

E.—Repairs.—The charges of the fitters and other departments for work done.

Arranged under these heads the total charges for the brake horse power given out by the electric motors are:

A.—Standing charges, £4,869 or 49.1 per cent.
B.—Fuel, £2,654 or 26.8 per cent.
C.—Labor, £1,183 or 12.0 per cent.
D.—Stores, £595 or 6.0 per cent.
E.—Repairs, £599 or 6.1 per cent.
Total, £9,900 or 100 per cent.

This shows that, roughly speaking, the standing charges account for half the expense, fuel for a quarter, labor for one-eighth, and repairs for one twentieth, the stores making up the total.

In addition it should not be overlooked that the cost of conductors and the loss of energy in them is naturally low, as the motors are comparatively close to the central station.

Wherever they are far apart the standing charges would preponderate still more.

Of the 49.1 per cent. charged as standing charges, 36.1 per cent. are unvarying, while 13 per cent. represent loss in leads and in conversion, and these will increase with an increasing output.

For instance, if the output of this particular plant were doubled so that the load factor would be .38, the expenses would be for, say, 2,400,000 B. T. U.:

Standing charges, £6,162, equals 38 per cent.
Fuel, £5,308, equals 32.65 per cent.
Labor, £2,366, equals 14.60 per cent.
Stores, £1,190, equals 7.35 per cent.
Repairs, £1,198, equals 7.40 per cent.
Total, £16,224, equals 100 per cent.

This is equal to 1.62d. per B. T. U. at the terminals of the switchboard, or just under 1.4d. per brake horse power per hour given out by the motors.

Of the standing charges 22 per cent. represent depreciation and interest, while 16 per cent. cover the losses in leads and in conversion.

A comparison between these two results shows again the importance of increasing the load factor to diminish the expense per unit of work done, or, in other words, if power is to be transmitted by electricity it is above all things necessary to use it as constantly as possible.

Conversely if in any particular instance power is wanted only at intervals and for short periods, it can safely be assumed that no economy can be effected by introducing transmission of power by electricity.

Similar considerations determine for the workshop whether it is more advantageous to drive a particular machine by its own electric motor, or whether it is more economical to group a number of machines together, driving them by belts from a shaft to which an electrical motor is attached.

Bearing in mind the property of electric motors of not absorbing more current than the load at each moment demands, and their high efficiency even at one-quarter of the full load, it will in most cases be possible to group machines together, especially smaller ones, as the cost of a counter-shaft and belting is in such cases less than the difference in the cost of one large motor and several smaller ones with all their accessories.

The most useful field for electric motors in workshops is without doubt their application to movable machinery such as cranes, travelers and drilling tools, a description of which need not be entered into.

Next to the importance of having constant work for the plant is the question of fuel consumption. Besides using the most economical boilers and engines the site of the power plant should be selected so as to secure the fuel at the lowest possible cost.

Whether water power would be cheaper than steam cannot be decided for all cases, as the answer depends on the amount of capital outlay required to secure an adequate supply of water at all seasons of the year, further, on the price of coal and other well known considerations.

At any rate it is very remarkable how very few localities can be found where a sufficient water supply may be depended upon all the year round.

An obvious solution of the problem, how to obtain cheap fuel, is evidently to erect the plant for generating electricity close to a coal mine, and to distribute power to the various works which usually are found in the neighborhood.

Such an installation has been erected at Brakpan,

* A paper read by Alexander Siemens before the British Association for the Advancement of Science.

in the Transvaal, and the electricity is conveyed from there along the Witwatersrand to various mines and railway stations up to Johannesburg, which is about 30 kilometers (19 statute miles) distance from Brakpan.

The generating plant was erected near a small lake, so as to secure water for condensing purposes all the year round, about 3 km. (2 statute miles) from a coal mine, with which it is connected by a private railway line, and all the latest improvements in the shape of mechanical conveyors and stokers were adopted to reduce the price of the fuel and the cost of labor.

Besides a separate plant for supplying all the auxiliary motive power and the station lighting, the works contain 4 main steam dynamos of 1,000 horse power each, that deliver three phase currents at 750 volts to transformers which raise the pressure to 10,000 volts.

The currents then enter the overhead main line of conductors, which is altogether about 40 km. (25 statute miles) long and has branches to the various mines, as circumstances require.

Each conductor consists of two bare strands of copper wire, each 70 sq. mm. in section, and elaborate precautions have been adopted to prevent these six strands from falling to the ground and from coming in contact with other wires crossing the main line.

Some trouble was experienced to protect the system against lightning, and it has been necessary to construct special apparatus before this difficulty could be overcome.

At the various mines transformers reduce the pressure of the current according to the purposes for which it is to be used, and they employ motors, varying in size from 1.5 horse power to 250 horse power.

In the month of July, 1895, the works at Brakpan were commenced, and on the 27th of January, 1897, the first steam dynamo commenced working. Since then the works have steadily been added to, but the data as to cost can obviously not be taken as a guide for other cases, as the regular working of the full plant has not yet settled down properly.

A somewhat similar system of distributing power over a district has been in operation near Waldenburg in Silesia for the last two years.

In this case the generating plant has been erected at the pit mouth, and it consisted at first of four steam dynamos each of 300 horse power, two of which produced three phase currents; the third, continuous currents to work a tram line about 22 km. (14 statute miles) long, while the fourth steam engine is coupled to one three phase and one continuous current dynamo serving as a stand-by for both systems.

For a radius of 4 km. (2½ statute miles) the three phase current is distributed at a pressure of 3,000 volts, at which it is generated, but for greater distances the current is transformed up to 10,000 volts.

Owing to the success of the enterprise two large three phase generators of 1,000 horse power are to be added as soon as they can be completed, and six more of the same size will be taken in hand in the near future.

The charge to the public for electricity is, in the district receiving current at 3,000 volts:

For lighting purposes, 50 pf. (equals 6d.) per B. T. U.

For motive power and heating, 15 pf. (equals 1.8d.) per B. T. U.

In the places supplied by the 10,000 volt currents the charges are 20 per cent. higher, but large consumers receive a discount according to the amount of current they use, amounting to 35 per cent. in cases where the value of current taken exceeds 10,000 mk. (£500) per year.

At these prices the 1,200,000 B. T. U. used in 1897 at the Siemens Brothers works at Charlton would have cost about £7,000, even if the higher prices of the 10,000 volt district had been paid.

It is characteristic of this country that these examples of transmission of power by electricity over a large district had to be taken from foreign practice.

However enterprising and progressive the individual Englishman is, when a novelty can be introduced only by the co-operation of a municipality, of a county council, or worst of all, of Parliament, everybody appears to consider it a patriotic duty to throw obstacles in its way, and in most cases it is quite impossible to find out who benefits by such action.

After a while the public discovers that the introduction of the novelty would be a great convenience, and an agitation is set on foot to remove the obstacles which were, in many cases, introduced only to satisfy prejudices.

Let us hope that a similar fate will not befall the transmission of power by electricity.

LONDON NOTES.

[From our London Correspondent.]

An Anglo-Cuban Cable Company and the War.

The Cuba Submarine Telegraph Company, Limited, seems to have been the gainer to a considerable amount by the lately concluded war, for its gross income increased to £33,504 for the first half of this year as compared with only £23,623 in the corresponding period of 1897. The chairman of the company has just paid a tribute to the splendid behavior of the staff in very trying times. The American censorship over the Western Union cables compelled the Spanish authorities at Havana to send their cable messages via Santiago and Jamaica, causing the increase in receipts mentioned. The American authorities then set to work to isolate Cuba as far as possible from the outside world and also to separate each chief town from the other where cable communication existed. Many of the Cuba Submarine Company's cables were cut, and their cable hut at Cienfuegos was entirely destroyed by the bombardment of the American fleet. The staff kept to their posts well, and the company was able to maintain communication from Havana and Jamaica right through the war. When the Americans entered Santiago they were greatly surprised to find the company's cables still working. The cables were sealed up, stopping the through traffic for about three months. The board is making claims on the American Government for the various expenses incurred by damage, etc.

Accumulator Omnibus at Berlin.

According to the *Electrical Review*, London, an omnibus has just been put on the streets of Berlin having a seating capacity of 20. It has a length of 7 meters and weighs with its battery of accumulators 6,650 kgs. The battery consists of 24 boxes, each containing five elements, and its total weight is 1,700 kgs., three-quarters of which is supported by the front axle which is the motive axle. The speed is 6 to 12 km. an hour, and the battery has to be recharged after a run of 60 km. At starting a current of 50 amperes at 225 volts is required; at a mean speed 35 amperes are sufficient, and 40 amperes are required for the maximum speed.

A Virginia Street Railway and Electric Association.

The Street Railway & Electric Association of Virginia was organized at Richmond on the 6th inst. with these officers: R. D. Apperson, president; E. R. Williams, vice-president; H. P. Woodson, secretary and treasurer.

The companies represented at the meeting were: Lynchburg & Rivermont, City Street Car Company of Staunton, Roanoke Power Company, Richmond Traction Company, Norfolk Street Railway Company and Norfolk & Ocean View Railway Company.

The object of the Association is the acquirement of scientific, experimental and other information in regard to street railway and electrical progress.

SOCIETY NEWS.

New York Electrical Society.

The 192d meeting of this Society will be held at the College of the City of New York, Lexington avenue and 231 street, on Wednesday, Dec. 14, at 8 P. M.

Col. Eugene Griffin, Colonel of the First Regiment of U. S. Volunteer Engineers and First Vice-President of the General Electric Company, will give an address on "Ideas Underlying the Organization of the Volunteer Engineer Corps; the Work Accomplished by it in Porto Rico, and the Opportunities of Further Usefulness."

Mr. W. D. Weaver, late Chief Engineer of U. S. S. "Glacier," Editor of the *American Electrician*, and Mr. F. W. Roller, late Chief Engineer U. S. S. "Nashville," will also address the Society on "Electrical and Engineering Work in the Navy during the War."

In this manner the relations of the engineering profession to both the Army and the Navy will be clearly brought before the members of the Society, and it is believed that the occasion will prove one of much general interest and value.

The meeting is open to ladies.

Special Meeting of the American Society of Civil Engineers.

At a special meeting of the above society to be held at 220 West 57th street, New York, this (Wednesday) evening, Hiram S. Maxim, M. Am. Soc. C. E., will deliver an illustrated lecture, in which the apparatus used in his experiments concerning artificial flight will be described and the evolution of the automatic gun illustrated. Slides showing the gunshops, etc., will be shown. A small Maxim gun will also be exhibited and fired with blank cartridges. Members are invited to attend and ladies will be welcome.

Exports of Electrical Material from New York.

The following are the exports of electrical material from the port of New York for the week ending December 6:

Alexandria, Egypt—6 cases, $947.
Argentine Republic, 6 packages, $481.
Australia—23 packages, $376.
Berlin—3 cases, $60.
Brazil—101 packages, $912.
Bremen—6 cases, $500.
British Possessions in Africa—10 cases, $280.
British East Indies—11 cases, $280.
British Guiana—27 packages, $650.
Cuba—9 packages, $113.
Central America, 1 case, $160.
Ecuador—1 case, $34.
Florence—1 case, $50.
Glasgow—18 cases, $1,438.
Hamburg—85 cases, $6,646.
Havre—68 cases, $2,741.
Helsingfors—8 cases, $500.
London—299 packages, $19,434.
Liverpool—8 packages, $1,893.
Leeds—11 cases, $367.
Mexico—40 packages, $1,837.
Milan—28 cases, $11,400.
Manchester—3 cases, $110.
Moscow—8 cases, $428.
Newfoundland—7 cases, $125.
Naples—5 cases, $255.
Oporto—36 cases electric motors, $5,600.
Preston—1 package, $10.
Stockholm—1 case, $386.
St. Petersburg—17 packages, $623.
Southampton—20 cases, $360.
U. S. of Colombia—4 cases, $300; 2 packages, $17.
Venezuela—7 cases, $227.

THE ELECTRICAL EXHIBITION COMPANY.

At a meeting of the Board of Directors of the Electrical Exhibition Company, held this day, Mr. H. L. Shippy was elected a director and vice-president in place of Mr. F. W. Roebling who resigned.

MARCUS NATHAN, General Manager.

New York, Dec. 7, 1898.

MADISON SQUARE GARDEN LEASED.

Mr. C. O. Baker, Jr., President of the Electrical Exhibition Company, has signed a lease of the Madison Square Garden for another Electrical Show to be held during May of next year under the auspices of and in connection with the 22d Convention of the National Electric Light Association. Although the last show occurred in May when the war interest was most intense it drew large crowds of people. Electrical development is so rapid nowadays and the newspapers have described so many of the newer and more wonderful inventions, that an exceedingly interesting and successful show is looked for. The officers of the Electrical Exhibition Company are: C. O. Baker, Jr., president; H. L. Shippy, vice-pres.; Geo. F. Porter, secretary and treasurer; Marcus Nathan, general manager; H. H. Harrison, L. F. Requa, J. W. Godfrey and C. Lieb, directors.

CANADIAN NOTES.

Notice is given on behalf of the Quebec, Montmorency & Charlevoix Railway that application will be made at the next session of the Dominion Parliament for an act amending the act incorporating the railway in the following particulars: To change the name of the company to the Quebec Railway, Light & Power Company; to ratify the purchase of the property and franchise of the Quebec District Railway Company by deed passed at Quebec on the 29th of June, 1898, the issues of bonds and stock made for the purpose of paying the purchase price thereof, and to authorize the company to build a line of railway or tramways in the counties of Levis, Bellebasse, Dorchester, Beauce and Lotbbiniere; to ratify the purchase of the property, works, plant, buildings, machinery and capital stock of the Montmorency Electric Power Company, and the issues of bonds and stock made by the Quebec, Montmorency & Charlevoix Railway Company in connection with purchase.

Owing to the small number of tenders received by the city council of Toronto, Ont., for the installation of a municipal electric light plant, it has been decided to accept none of the tenders. From the tenders submitted it was found impossible to arrive at even an approximate cost of an electric plant. No tenders were received from Canadian manufacturers. In this connection the Anglo-American Electric & Supply Company have made a proposition to supply electric energy to the city. Power is offered at cost after paying a dividend of 10 per cent. to the shareholders upon a capital stock of $5,000,000. It is guaranteed that the cost to the public will not exceed one cent per horse power per hour.

Mr. J. Geo. Gardner, of Baltimore, Md., has been in Ottawa with a view to ascertaining the commercial value of the experiments made in the manufacture of calcium carbide. He examined the carbide which he saw manufactured from the Emerson process, and after experimenting with it was pleased to discover that slag and other impurities were wholly absent from the carbide produced from sawdust. It is said that Mr. Gardner is empowered to purchase the product of Mr. Emerson's plant in case Ottawa, the most favorably situated location known in regard to natural and artificial conditions, will undertake the manufacture of this article of commerce.

LEGAL NOTES.

Justice Collins of the Supreme Court at Trenton, N. J., on the 5th inst., filed an opinion upholding the constitutionality of the "Squire" trolley law, under which the Elizabeth City Railroad Company received a franchise to build an electric railway between Elizabeth and Plainfield. The company is controlled by ex-Congressman John Kean, who made the highest offer ($250,000) for the franchise. The law was attacked on the ground that it was special legislation, but the Supreme Court overruled every objection.

James H. Cluggage, who agreed to light the town of Sullivan, Ind., by electricity for $50 a year for each arc light furnished, gave up the job after two months' trial. The town made a new contract with other parties at $63 a year for each light and sued Cluggage and his bondsmen for the difference in price. The Circuit Court held in favor of the defendants, but the Appellate Court has reversed its judgment, holding that they had not presented a sufficient defense to the action.

The suit of the Fountain Head Railway Company against J. Simpson Africa, trustee, and the Knoxville Street Railway Company, which is now known as the Knoxville Traction Company, was decided in the Circuit Court at Knoxville, Tenn., a few days ago. The roads had entered into a contract in regard to the use of tickets. This contract was to last for twenty years, and the first of the two parties who should violate the same was to forfeit to the other party $10,000. Just before the Knoxville Street Railway Company was reorganized as the Knoxville Traction Company the contract was broken by the Knoxville Street Railway Company, and the Fountain Railway Company brought suit for $10,000 for breach of contract. The decision secured in Judge Sneed's court gives the Fountain Head Railway Company a verdict for $10,000, and the amount of damages claimed under the contract.

At Kokomo, Ind., on the 1st inst. Judge Brownlee, of the Superior Court, rendered a decision in the electric light receivership case, to the effect that necessary current expenses incurred before the appointment of a receiver are preferred to the mortgage lien existing in favor of the bondholders. The decision is based on the idea that an electric light company is a quasi public corporation, and the discharge of its duties is of public interest, and that if current expenses are not provided for it would be to the detriment of the public. Money since collected and expended on the plant should have been applied to the indebtedness of the former current expense.

Proposals Invited.

The Chief of the Bureau of Yards and Docks of the U. S. Navy Department is inviting sealed proposals until December 23 for enlarging the electric light and power plant at the Boston Navy Yard. Bids will also be opened on the same date for extending the wiring system at the same yard. Specifications, blank forms of proposal, a general plan and a wiring plan will be furnished intending bidders upon application to Mordecai T. Endicott, Chief of Bureau, Washington, D. C., or the Commandant of the Boston Navy Yard. Bidders are expected to inform themselves of the character of the work by visiting the navy yard.

The U. S. Treasury Department is inviting sealed proposals until December 27 for installing a system of iron armored conduits or cold drawn steel tubing with interior non-corrosive lining, wiring and distribution tablets in the United States Post Office building at Paterson, N. J. Plans and specifications may be had upon application to the Department.

The Bureau of Supplies and Accounts of the Navy Department is inviting sealed proposals until December 20 for furnishing the Navy Yard at Portsmouth, N. H., with one steam engine and one direct current dynamo. Specifications, blank forms of proposal, and all necessary information will be furnished upon application to the Navy Yard at Portsmouth, or to the Bureau at Washington, D. C.

THE NEWS.

What is Going On in the Electrical World.

STREET RAILWAYS.

Akron, O.—The officials of the Akron, Bedford & Cleveland electric road state that the road is to be double-tracked at once between Cuyahoga Falls and Newburg. When this is done there will remain not more than two miles of single track on this road and this strip will be doubled next summer.

Belfast, Me.—James Mitchell, the Portland railroad contractor, expects to begin in the spring the construction of an electric road between Belfast and Northport camp ground. This will be one of the sections of the long looked for trolley line between Bangor and Rockland.

Bound Brook, N. J.—The borough council has passed the ordinance granting a franchise to the New York & Philadelphia Traction Company on East street to the Somerset county line. This grant will enable the company to complete its system.

Clinton, Mass.—Many business men of Clinton with money to invest are talking seriously of the feasibility of constructing another electric railway from Clinton to Worcester. The plan is not intended to interfere with the successful operation of the new Worcester & Clinton line, which is approaching completion, but the object is to provide cheap and convenient transit to Sterling camp grounds and as a pleasure trip around the great Wachusett basin.

Dayton, O.—Col. Fred Colburn, president of the Dayton, Springfield & Urbana Electric Railway Company, has filed a bond of $20,000 as a guarantee to the city that the road will be completed within the time specified in the franchise. Work has already begun at Springfield.

Frankton, Ind.—At a meeting held here by the promoters of the Hartford City and Indianapolis electric road, the reports of several township committees along the proposed route were read. They were very encouraging, and it now seems that enough money will be pledged by the different townships to make the road a certainty. It was decided to run the line through Lapel, instead of Noblesville, as was originally intended, down White river to Perkinsville, and thence across the country to Indianapolis.

Marshall, Tex.—C. J. Randall of Shreveport contemplates building a mammoth hotel at Hinson Springs, six miles west of this city, and also an electric railway from this city to the springs.

Mount Vernon, N. Y.—The common council has granted the New York, Westchester & Connecticut Traction Company a fifty years' franchise over twenty miles of the streets and avenues of this town. This company, in connection with the People's Traction Company of New York, which holds franchises in the borough of Manhattan, is said to be controlled by the Nassau Electric Company of Brooklyn. The traction company has furnished a bond of $25,000 as a guarantee that they will have the road in Mt. Vernon completed and in operation on or before August 2, 1899.

New Castle, Pa.—A party of engineers has been in this vicinity several days making the survey for a new street car line that is to run from New Castle to Youngstown, O The application for the charter has already been made for the line from New Castle to the State line.

Philadelphia —The Union Traction Company has decided to equip all its lines with larger cars in order to provide more adequate accommodation for its patrons.

Radford, Va.—Judge Cassell, of the Hustings Court of this city, has confirmed the sale of the Radford street car line to Mrs. Ella M. Crockett for $3,505.

St. Louis.—A deal has been closed by which the Southern Electric Railway Company of this city, for a consideration of $3,500,000, has become the owner of all the lines and equipment of the National Railway Company, better known as the Hamilton syndicate. The property includes the Northern, Central, Cass Avenue & Fair Grounds, Union, Citizens, Baden and Southwestern lines, all electric, and the St. Louis line, or Broadway cable. They represent 95.04 miles of track, of which 80.37 miles are electric and 14.67 miles cable. Following this sale comes the announcement of the sale of the entire Lindell system to a syndicate represented by the New York ba king firm of Brown Bros., for $8,500,000. A few weeks ago the Lindell Railway Company had the life of its franchise extended for fifty years, after a bitter fight in the council, the mayor signing the bill over the protest of many prominent citizens. It looks now as if the entire street railway interests of St. Louis will soon be under the control of a single corporation.

Toledo, O.—The Detroit & Wyandot electric road, now in operation between Detroit and Wyandot, has been purchased by T. C. Hutchins and A. B. Du Pont of Detroit, and it is understood that the road will be extended from Wyandot to Toledo, making a continuous trolley road between Toledo and Detroit.

Washington, D. C.—The car shed of the Eckington & Soldiers' Home Railway, at Fourth and T streets northeast, was destroyed by fire on the night of the 3d inst. Ten double deck observation cars, valued at $2,000 each, were burned. The total loss is estimated at $65,000. The

property burned was not long ago acquired by the new City & Suburban Railway Company, together with the other equipments of the old Eckington & Soldiers' Home Railway Company.

Williams Bay, Wis.—The proposed electric railroad from Harvard, Ill., to the head of Geneva Lake is now almost certain to be built. H. N. Bates, general manager of the Continental Construction Company of Boston, has offered to build and equip the road and have it in operation by June next.

Wilmington, Del.—The Wilmington & Brandywine Springs Electric Railway was formally opened on the 8th inst. The line extends from Wilmington into the country about six miles, and has its terminus at Brandywine Springs, a picturesque spot on the Red Clay Creek. At Brandywine Springs a pleasure resort will be started and opened next summer. The Wilmington & Elsemere Electric Railway on the 8th inst. passed into the hands of its new owners, who also own the Wilmington & Brandywine Springs Railway. The new owners organized by electing the following officers: President, R. W. Crooks, of Brandywine Springs; secretary and treasurer, Dr. L. H. Ball, of Faulkland; directors: Mr. Crooks, Dr. Ball, F. L. Barry and John Dobson of Philadelphia, and William S. Hilles of Wilmington.

LIGHTING.

Bellevue, Pa.—A. M. Voight, representing the Pennsylvania Light, Heat & Fire Company of Allegheny, asked the council that a franchise be given his company to furnish light, heat and fire in this borough. He offered to pay the borough 2 per cent. of the gross receipts. The company has been organized to utilize the waste electric power of the United Traction Company for lighting, heating and cooking purposes. It is intended to build a plant on the Ohio river front.

Chestertown, Md.—The electric light company has accepted the offer of the town commissioners and agrees to furnish and maintain eighty thirty-two candle-power incandescent lamps for the sum of $12.50 per year each.

Chicago.—A dispatch from Wabash, Ind., to the "Inter-Ocean" states that "information of a big combination of electric light plants in twelve Northern Indiana cities was given out on the 4th inst. The project includes the transfer to a company with $1,000,000 capital of all the property and franchises of the companies, options amounting to nearly $500,000 having been secured on the systems. Another $500,000 will be expended in providing for supplying electricity for power on a gigantic scale. In addition to the leading stockholders of the local companies the company will include P. J. Sorg, the millionaire tobacco man of Middletown, O.; Fletcher Heath of Hamilton, O., and banking interests at Indianapolis and New York. The organization will be completed in New York about January 1."

Danville, Ill.—The Danville Electric Light Company has backed out of its proposition to light the city at the rate of one dollar a light per year provided it was given the exclusive right to furnish electric lights within the city.

Hagerstown, Md.—The council has passed an ordinance providing for the issue of $60,000 of bonds for the erection of an electric light and power plant.

Hastings, Neb.—Denver parties are in Hastings for the purpose of organizing a company to purchase the present electric light plant. It is proposed to make it one of the best plants in the West.

Ilion, N. Y.—A movement is on foot to allow the taxpayers of this village to express their wishes by ballot at the next charter election either "for" or "against" instituting an electric light plant to furnish arc and incandescent lights for streets and domestic purposes, to be owned and operated by the village. The present arc system is owned by the Herkimer County Light & Power Company, who have given good service. The action of adjacent villages to own and maintain their own system of lighting has caused the agitation of this question in Ilion.

Indianapolis, Ind.—Daniel A. Chenoweth, promoter of the Chenoweth Light & Power Company, with his application for a lighting franchise in this city filed a bond of $25,000 as a guarantee. The company will cater only for that part of the city outlying the territory bounded by North, West, South and East streets.

Lincoln, Ill.—Some leading residents of Lincoln, together with Henry G. Herget and W. J. Conzelman of Peoria, intend to erect and equip a first-class electric light plant to supply public and commercial lighting. The company, which will be known as the Logan County Electric Light Company, has a paid up capital of $10,000.

Marquette, Mich.—This city is to be made the scene of a Government experiment in illuminating its lighthouses and breakwaters on the lakes by means of electricity. The experiment will be tried here in the course of a week or two, and if it is successful kerosene will be superseded by electricity all over the great lakes where the new illuminant is obtainable. A submarine cable will be laid to the lighthouse on the extreme end of the breakwater in the lower harbor.

Middleport, N. Y.—The trustees have advertised for bids for furnishing electric lights for the streets, etc. If the prices are low enough a five-year contract will be made with the successful bidder. Bids will be received until the 14th inst.

New Orleans, La.—Another electric company has been organized here and is said to have contracted with the Western Electric Company of Chicago for the construction and equipment of the entire plant. The new concern is the Merchants' Electric Light & Power Company, and its officers and directors are: President, M. Ber; vice-president, Joseph Simon; secretary, treasurer and general manager, E. W. Goldschmidt; directors: C. D. Crandall, A. McEwen, Julian Cohn, E. H. McFall and E. W. Goldschmidt. The company is operating under the Cohn and Ber franchise.

Paulsboro, N. J.—The Business Men's League of this place has started a movement for the purpose of having the town lighted by electricity.

MANUFACTURING, ETC.

Binghamton, N. Y.—Parties reported to be representatives of an international syndicate, and one of whom is an electrical engineer of New York, have been selecting a site for a large factory to be erected here. They decline to tell the line of manufacture in which they are to engage, but it is understood that it is electrical goods.

Irwin, Pa.—The Penn Electrical Manufacturing Company of Wilkinsburg has about decided to remove its plant to Irwin, the citizens of this place having agreed to donate a site and raise a cash bonus of $5,000. The plant manufactures all kinds of electrical appliances, globes and fixtures. F. C. Hockensmith and D. M. Wagner of Irwin are the principal stockholders in the company.

Mechanicville, N. Y.—A company has been organized to establish works here for the manufacture of all kinds of electrical supplies.

New York.—The "Journal of Commerce" of the 8th inst. says: "A member of a leading electrical engineering concern said yesterday that in railroad work the outlook for business was never better. The bulk of the orders are coming from the principal European cities. There are so many branches of trade interested in the development of electrical works that its promotion means considerable exports in the machinery line. There are said to be eight roads in England, two in Holland, four in Buenos Ayres, one in Cuba and two in Brazil figuring now on entire American equipments. They are to make the change from horse to electrical traction. The number of new roads contemplated are many and the inquiries in their behalf are from every part of the world."

Philadelphia.—A representative of the Philadelphia Commercial Museums, who has recently returned from Brazil, reports a marvelous increase in the demand for electrical goods in South America. He says that every town or city within 300 miles of the coast is lighted by electricity, and electric plants are being put in operation everywhere.

Ogdensburg, N. Y.—The prospects are considered good for the establishment in this city of a manufacturing plant to employ at least 150 men. A syndicate, at the head of which is Charles S. Westbrook, is to manufacture an improved electric light and power generator, and has obtained from the owners of the patent the right to make and sell the machines in sixteen counties of New York State. Instead of dynamos, a new device with storage batteries is used to generate the electric fluid.

Schenectady, N. Y.—The General Electric Company has received an order from the company which is constructing the underground street railroad in Paris for eight electric locomotives and the large quantity of apparatus that goes with them. The locomotives will be capable of pulling a train of five cars at a high rate of speed. The length of the road will be three miles.

Springfield, Ill.—The Crocker-Wheeler Electric Company has been licensed to do business in Illinois.

Victoria, B. C.—Mr. R. Cassidy at the coming session of the Legislature will apply for the incorporation of companies to build a railway from Taku inlet to Atlin lake; to operate electric lighting plants in Cassiar; to build a railway from Fort Simpson to Glenora, and to build cable, telegraph and telephone lines from Victoria to Teslin lake.

Washington, D. C.—Captain R. B. Bradford, Chief of the Bureau of Equipment of the Navy Department, in his annual report regards with much concern the constantly increasing demand for repairs and renewals for electrical outfits and supplies of ships. He says that as a monopoly practically controls the most important electrical supplies, with the usual high prices, he considers it advisable to erect at the New York Navy Yard sufficient appliances for the manufacture of the articles now purchased.

Watertown, Mass.—The recent adoption of electricity in operating the large electric crane in the Government Arsenal here is proving a great improvement on the old method. The crane has a lifting capacity of 45,000 lbs., is worked by one man and transports its load the whole length of the building, 288 feet, in one minute. Half a dozen hands were necessary to propel the crane from point to point by the old system and nearly an hour has often been consumed in moving it the length of the building.

POWER AND TRANSMISSION PLANTS.

Richmond, Va.—A charter has been granted to a construction company formed for the purpose of erecting a plant in this city to be used for the development of the water power of James river. The power so developed will be used in the generation of electricity to supply light and power for private and for manufacturing purposes. The capital stock of this company is to be not less than $5,000 nor more than $100,000, to be divided into shares of $100 each. The officers for the first year are as follows: President, R. Lancaster Williams of Richmond; vice-president, F. C. Todd of Baltimore; secretary and treasurer, A. W. Weddell of Richmond.

COMPANY MATTERS.

Bath, Me.—The report of the committee which has been investigating the affairs of the Bath Gas & Electric Company has been published and shows that the company was in rather bad financial condition. The plant is likely to pass into new hands now that its condition has been at last straightened out, and it is said that several Bath capitalists are talking of purchasing when the proper time arrives.

Lancaster, Pa.—William Given, receiver for the Pennsylvania Traction Company, announces that steps have been taken for a complete reorganization of the company at an early day. The United States Circuit Court recently granted a decree for a final adjustment of all accounts and the filing of liens against the road and the amounts due thereon of the respective lines, from which they shall be paid. This report will be submitted to the master, George L. Crawford of Philadelphia, who will order a sale of the road. The following committee on reorganization has been appointed: W. B Given, chairman; Samuel R. Shipley of Philadelphia, J. W. Bausman and John D. Skiles of Lancaster. The new company will be known as the Conestoga Traction Company. Receiver Given also announces that the receipts for the fiscal year ending November 30 were $200,170.62, an increase of $15,005.31 over 1897.

Rockford, Ill.—The stockholders of the Rockford Railway, Light & Power Company have voted to increase the capital stock from $250,000 to $350,000.

PERSONAL AND MISCELLANEA.

Mrs. Iva E. Tutt is the manager of an electric plant at Long Beach, Cal., about twenty miles from Los Angeles, and she has written for the Louisville "Courier-Journal" a brief account of herself as promoter and manager of a successful business. In her sketch she says: "Long Beach is one of the most beautiful sea coast towns of Southern California. Within a short distance lies Terminal Island, a fashionable resort, and further away San Pedro, the future seaport of Los Angeles and the surrounding country, where the Government is spending three millions of dollars to improve the harbor. These three towns are joined by an electric circuit and successfully lighted from the one central station. I came to South California in the spring of 1895, and located at Long Beach. I foresaw the future of this favored locality and decided to invest my means in and devote my energy to an electric plant. At that time these towns were lighted by oil I applied for franchises, bought the machinery and necessary grounds, directed all the details of the construction from the setting of the boilers to the construction of the pole lines. Eventually I found myself at the head of a model plant with miles of wires and an ever-increasing patronage. At times I have had to operate the station when the needs of the work called the men elsewhere. The plant is a modern one in every respect. The present equipment consists of a Sterling water-tube boiler fitted for mechanical draft, a tandem-compound engine and dynamos for direct and alternating currents. The direct current distribution is by the three-wire system. I am a native of Minnesota, a Daughter of the Revolution, and, if it interests any one to know, trace my ancestry to the colonial days."

The electric tramway at Cripple Creek, Col., running to Victor, is a little over six miles long, and consists almost entirely of grades and curves. The round trip occupies about one hour and twenty-nine minutes, which it is expected will be shortened to one hour. The electricity is generated by water power at Lake Moraine, at an altitude of about 10,000 feet on Pike's Peak, and transmitted by wire nearly a dozen miles to a distributing station midway on the line of the railroad. The entire route of the road is one succession of gold mines, while all the mountain slopes in view are dotted with the dumps and in many cases the shaft houses of mines in various stages of development. At Midway (the station for Altman, "the highest incorporated town on earth"), the line is 10,514 feet above sea level, and affords a magnificent panorama. The six incorporated towns of the Cripple Creek district have for some time past been lighted by electricity. A miner can already in many places in the district ride to his work in an electric street car, descend the mine in a hoist operated by electricity, and follow his work underground by an electric light.

INCORPORATIONS.

The Allentown & Slatington Street Railway Company Allentown, Pa.—to build and operate an electric railway. Capital stock, $200,000. Directors: Francis J. Crilly, Allentown, president; John L. Schwartz, Patrick F. Cannon, Walter J. J. Saeger, Allentown; Francis A. Kreitz, Slatington.

The South African General Electric Company of Schenectady, N. Y.—to deal in electrical apparatus, machines, engines and mechanical devices, and to construct works and plants involving their use in the United States, South Africa and other foreign countries. Directors: S. D.

Greene, Henry W. Darling, D. Mazent, J. B. Lovejoy and M. F. Westover of Schenectady.

The Groton Electric Company, Groton, Conn. Capital stock, $2,000.

The Victor Electric Company, Chicago, has certified to an increase of capital stock from $2,400 to $5,000.

The Natchez Light, Power & Transit Company, Natchez, Miss. Capital stock, $200,000. Incorporators: Maurice Moses and Abram Moses.

The Clarendon Light & Heat Company, Clarendon, Ark. Capital stock, $6,000. President, J. W. B. Robinson; vice-president, H. H. Bateman; secretary and treasurer, J. T. Jones.

The Greenup Light Company, Greenup, Ky.—to erect and maintain an electric light plant in the town of Greenup. Capital stock, $5,000. Incorporators: Charles Schmutz, J. E. Pollock and R. E. L. Wilson.

The Electric Haulage & Manufacturing Company, Brazil, Ind.—to manufacture motors and machinery. Capital stock, $10,000. Directors: James H. McClelland, Brazil; Edmund C. Morgan, Charles B. Niblack, Chicago, Ill.

The Williamsport Water & Light Company, Williamsport, Ind.—to operate a water system and furnish electric light. Capital stock, $10,000. Directors: John H. Brown, B. O. Mayer and George Mayer.

The Russell-Tomlinson Electric Company, Shelton, Conn.—to manufacture, buy, sell and deal in electrical goods and wares. Authorized capital, $20,000; paid in, $17,000. Incorporators: G. G. Milne, C. B. Barker, New York City; W. W. Tomlinson, Shelton; W. E. Russell, Danbury.

The Delaware County Electric Light & Power Company, Clifton Heights, Pa.—to supply light, heat and power by electricity. Authorized capital, $5,000. Incorporators: C. M. Wagner, E. O. Kane, Lansdowne; R. S. Austin, Philadelphia; S. Haigh, Aldan; J. S. Austin, Yeadon.

The Wardner-Kellogg Electric Railway Company, Wardner, Wash.—to build an electric railway from Kellogg, through Wardner, to the Bunker Hill mine, and from Kellogg to Government gulch. Capital stock, $500,000. Directors: Bartlett Pressley and Margaret Pressley of Kellogg, Lawrence O'Neill of Wardner and William W. Woods of Wallace, Wash.

ELECTRICAL PATENT RECORD.

Letters Patent Issued December 6, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

615,420. Electrical Connection. William E. Baker, Chicago, Ill., assignor to Carter H. Fitz Hugh, same place. Filed July 13, 1896.
615,592. Electric Locomotive. Martin E Thomas, Cassaday, Ky., assignor of three-fourths to W. F. Toops and H. L. Hendrick, Bowling Green, Ky. Filed July 12, 1897.
615,594. Electric Locomotive and Truck. Samuel M. Vauclain, Philadelphia, Pa. Filed Dec. 29, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

615,407. Electric-Arc Lamp. Moses S. Okun, New York City. Filed June 3, 1895.
615,408. Electric-Arc Lamp. Moses S. Okun, New York City. Filed Oct. 21, 1895. Renewed May 28, 1898.

ELECTRICAL MACHINERY AND APPARATUS.

615,255. Alternating-Current Dynamo-Electric Machine. Sebastian Z. de Ferranti, Hollinwood, England. Filed Dec. 28, 1897.
615,351. Dynamo-Electric Machine. John E. Fuller, New York City, assignor to Caleb Coles Dusenbury, Lake Mahopac, N. Y. Filed March 24, 1898.
615,388. Apparatus for Operating Electric Switches. Charles Hartdegen, Newark, N. J. Filed July 30, 1897.
615,395. Circuit-Breaker. Frederick A. La Roche, New York City. Filed Dec. 28, 1897.
615,418. Automatic Rheostat. Eleazer T. Wilkinson, Philadelphia, Pa. Filed May 8, 1897.
615,419. Rheostat. Charles Wirt, Philadelphia, Pa. Filed July 23, 1897.
615,491. Automatic Weighing-Machine. Francis H. Richards, Hartford, Conn. Filed Nov. 26, 1897.
615,652. High-Frequency Apparatus. Thomas B. Kinraide, Boston, Mass. Filed May 13, 1897.
615,653. High-Frequency Induction Apparatus. Thomas B. Kinraide, Boston, Mass. Filed March 4, 1898.

TELEPHONE AND TELEGRAPH APPARATUS.

615,344. Telephone. Franz Burger and Henry M. Williams, Fort Wayne, Ind.; said Burger assignor of one-half to said Williams. Filed Aug. 16, 1897.
615,349. Electric Cable Conductor. Stephen D. Field, Stockbridge, Mass., assignor to the American Bell Telephone Company, Boston, Mass. Filed Dec. 24, 1897.

BATTERIES.

615,246. Electric Battery. Owen T. Bugg, Jr., New York City. Filed March 15, 1898.
615,292. Electric Battery. Maurice Maas, New York City. Filed Sept. 7, 1897.
615,539, 615,540, 615,541. Electric Battery. Philip A. Emanuel, Aiken, S. C. Filed May 17, 1898.

MISCELLANEOUS.

615,317. Electric Switch. William Ely, Providence, R. I. Filed Aug. 11, 1895.
615,385. Electrical Appliance for Elevators. James H. Roberts, Grand Rapids, Mich. Filed Dec. 27, 1895.
615,581. Block-Signal System. William L. Stockton, Trenton, Ohio. Filed Dec. 20, 1897.

DESIGN.

29,782. Insulator. Jacque L. Morgan, Kansas City, Mo. Filed Sept. 6, 1898.

TELEPHONE AND TELEGRAPH.

Snow and Telephone Wires.

A Swiss electrical engineer calls attention to the importance of devising some means for the prevention of heavy accumulations of snow on telephone lines. It frequently happens that these wires are placed in the neighborhood of electric currents of the high tension used in the majority of towns, and breaking of the telephone wire may in an instant lead to the diversion of heavy currents and the possibility of loss of life. In ordinary weather the weight of snow lodged on the wires is inconsiderable, but during heavy falls of snow this accumulation may become serious. It was estimated that on the lines in the neighborhood of the meteorological station at Zurich, during a storm in April last, there was a weight of 60 kilograms of snow on a stretch of 100 meters, or more than forty times the weight of the wire itself. Between the two posts supporting the 250 wires traversing the Lurimat, at a distance of about 100 meters apart, the additional weight from the snow was about 15,000 kilograms. This is not the only source of danger in winter. The tension resulting from a sudden fall in temperature to the neighborhood of zero greatly increases the chance of sudden breakages from whatever reason. The question of adopting some means of lessening the danger from the snapping of telephone wires is being actively taken up in Europe.

There has been erected in the city of Brussels, Belgium, a spacious building to be devoted exclusively to the telephone service of the country, and it is now expected it will be open to the public some time during the coming year. The building is situated in the old quarter of the city, the selection of the location being no doubt influenced by economical reasons, as the land was Government property. The construction of the building has cost very nearly $193,000, and there will be commutators for 15,000 subscribers. The building comprises a basement, ground floor, and three stories. The room devoted to the commutators has a length of 147 feet, a width of 65 feet, and a height of 30 feet. Below the massive concrete foundation, a series of iron rafters has been laid to facilitate the flowing of electricity into the ground. Steel shanks are attached to these rafters and connected with the iron pieces of the building in all directions in such manner that the entire construction is united in a Faraday cage, which thoroughly protects it against lightning. On account of the large number of overhead traction cables already existing in Brussels, and the impossibility of a much further increase in the number or dimensions of telephone support frames, it has been decided to put nearly all the wires of the telephone service underground, and in consequence cables containing two hundred wires will be placed in underground conduits to be distributed in the various quarters of the city.

Elias E. Ries, one of the charter members of the United States Automatic Telephone Company, recently incorporated at Albany, N. Y., with a stated capital of $1,000,000, is the inventor of the new system which the company was organized to control. By his invention, he says, connection between the telephone subscriber and the central office is effected automatically through the flow of a small quantity of mercury, which is placed in the receiver, the tilting of the receiver as it is lifted to the ear causing the mercury to make the connection. Mr. Ries claims that in his system the cost of insulation is less than half that of the Bell system. From the central exchange they could give 65 to 70 per cent. more service, and consequently operate profitably at much lower rates than the Bell company.

At Springfield, O., the Central Union Telephone Company, after a hard fight against four other companies, has been granted the right to construct an underground conduit system in the central part of the city, the construction to be commenced within 90 days from passage of the ordinance. The action was taken by the Board of Public Affairs after a heated presentation of claims by representatives of the different companies seeking the franchise. The action of the board excludes all others so long as the Central Union will give a first-class service at reasonable rental. The rates will be reduced and the city will receive five new telephones free, besides the number granted under the old franchise.

The Standard Telephone Company is about to extend its line into La Crosse, Wis. For some time the work has been in progress and now the line extends through southern Minnesota and has reached a point on the Minnesota side of the river opposite La Crosse. A cable will be laid in a few days connecting the line with that of the La Crosse Telephone Company. Arrangements have been made whereby the Rushford Telephone Company will use the cable of the Standard Company. This extension will give La Crosse connection with all points in southern Minnesota.

A conference between the officers of the Iowa and Nebraska divisions of the Bell Telephone Company and two independent toll lines operating in Iowa, Minnesota and North Dakota was held last week in Des Moines, Ia. The conference was held relative to traffic arrangements between the three companies—for the consideration of the arrangement of joint use of wires and joint rates. The conference is the first of the kind ever entered into in Iowa by the Bell Telephone Company. It is important in that it is evidence of a new policy on the part of that system's management to work with the independent and Mutual toll lines.

At a public hearing at Boston on the 8th inst. on the petition of the Massachusetts Telephone & Telegraph Company for locations in the streets of Boston, a paper was presented signed by Oakes Ames, Albert O. Titcomb, E. P. Shaw, John Shepard, George A. Alden, D. L. Demmon, Francis W. Breed, W. H. Brewster and Benjamin Deckerman, who in case a franchise is granted agree to join in the organization of the new company, which will have a capital of between $2,000,000 and $3,000,000. It is proposed to cut present rates in halves.

The East Tennessee Telephone Company (Bell) is said to have made arrangements for putting in a plant at Richmond, Ky., and proposes to compete with the Richmond Telephone Company, which was one of the first local companies organized in the State. The rates of the local company are $2 per month for offices and $1.50 for residences, which rates the newcomers propose to smash, putting in their instruments in offices for $1.50 and in residences for $1.

There is a fight on at San Jose, Cal., between the People's Telephone Company and the Sunset Telephone Company, in which the latter is backed by the city officials. The citizens and business men especially, recollecting the high rates that prevailed before the People's Company's advent, are however disposed to stand by the latter.

In order to bring the military telegraph and telephone service in Cuba up to as high a standard as possible, Lieut. Col. H. H. C. Dunwoody of the Signal Corps has been directed to proceed to Havana and take charge of the entire system. The work of construction and repair will be accomplished by parties of enlisted men in the Signal Corps.

The contract of the New York & New Jersey Telephone Company to put telephones in thirty-seven schools and the homes of the three school superintendents for $31,000 has been approved by the borough board of the Borough of Queens.

The Bell Company having gobbled up several independent companies in Minnesota is now turning its attention to Iowa, where it has succeeded in taking in two small companies, which together operate about 200 miles of line.

The exchange of the Cumberland Telephone and Telegraph Company at Memphis, Tenn., was damaged by fire on the 8th inst. to the extent of $7,000. The battery room was totally destroyed.

New Companies Incorporated.

The Pacific Automatic Telephone Company, Seattle, Wash. Capital stock, $100,000.

The Danville Telephone Company of Danville, Ill., has certified to an increase of capital stock from $25,000 to $50,000.

The Automatic Telephone Company, New Bedford. Capital stock, $100,000. Incorporators: J. W. Macomber and Frederick Tabor.

The Northern Illinois Telephone Company, Hinckley, Ill. Capital stock $10,000 Incorporators: Fred E. Graves, Milton D. Patten and Fred R Patten.

The Hinton & Southeastern Telephone Company, Hinton, W. Va. Capital stock, $50,000; paid in, $10. Incorporators: A. J. Skaggs, James H. Miller, J. J. Swope, C. H. Skaggs and W. H. Bonde.

The United States Automatic Telephone Company, New York City—to manufacture and deal in telephonic and electrical apparatus. Capital stock, $1,000,000. Directors: Elias E. Ries, Martin Lowenstein, Henry A. J. Wilkens, Israel Steinhart and Henry J. Furlong, of New York City.

The Printing Telegraph & Typewriter Company, St. Paul, Minn.—to acquire, own and lease telegraph and typewriter instruments, etc. Authorized capital, $200,000. Incorporators: Casper Ernst, St. Paul; Frederick Hachman, Milwaukee; Charles Pfeifer, Plymouth, Wis.

The Homestead Telephone Company, Homestead, Pa.—to construct and maintain telephone lines. Authorized capital, $10,000. Incorporators: Dr. G. Gladden, R. Kennedy, J. Purman, D. H. Carus, A. J. Kuhn, W. S. McConegby, H. J O'Donnell, Homestead. Reid B. Kennedy has been elected president of the company, A. J. Kuhn treasurer and Dr. John Purnam secretary.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 12.65@12.75c.; Lake, 12.75@13c.; casting, 12.65@12.75c.

Cleveland City Railway stock sold at 83 last week, the highest point in its history.

The Commercial Cable Company has declared a quarterly dividend of 1¾ per cent., payable January 3. Books close December 21 and reopen January 4.

The Boston Elevated Railway Company has declared a semi annual dividend of 2½ per cent., payable January 2. Books close December 19 and reopen January 3.

The United Traction & Electric Company, Jersey City, has declared a dividend of 1 per cent., payable January 3. Transfer books close December 21 and reopen January 4.

Chicago dispatches say that no kind of a franchise ordinance for the street railway companies of that city will pass the city council until the Allen law is repealed by the State Legislature.

The application of the Knoxville (Tenn.) Traction Company to the Baltimore Stock Exchange for the listing of $750,000 of stock and $850,000 of bonds has been favorably reported on by the committee on securities of the institution.

The Milwaukee Street Railway Company, through Vice-President Henry C. Payne, has withdrawn its proposition to pay $2,650,000 for immunity from hostile legislation for an exclusive franchise and the preservation of the five-cent fare for twenty-five years longer. This leaves the situation exactly the same as it was before.

A Columbus, O., dispatch states that arrangements are being made for the consolidation of the Edison Electric Light & Power Company, the Columbus Gas Company and the Columbus Electric Light & Power Company, of that city. It is stated that parties representing the companies have left for New York to complete the deal.

An answer has been filed at Pittsburg, Pa., to the suit charging fraud and conspiracy in connection with the reconstruction and re-equipment of the Pittsburg & Birmingham Traction road. The traction company was the plaintiff. The defendants, H. Sellers McKee, Murry A. Verner, David C. Brickell and others, deny all the allegations.

A dispatch from Hartford, Conn., states that the Meriden, Southington & Compounce Tramway Company has prepared a petition to the General Assembly for permission to increase its capital stock to $500,000, with rights to build and extend its tracks from Milldale to Mt. Carmel, to Waterbury, to Meriden and to Berlin, by an independent route, and to Plainville from its present Southington terminus, from Dunham's, on Queen street, to Compounce Lake, and to build a cable road to West Peak.

The directors of the Edison Electric Illuminating Company of Brooklyn have issued in pamphlet form a history of that corporation's organization and growth. The company was incorporated in 1887 with a capital of $500,000. At the time of its purchase by the Kings County Electric Light & Power Company its capital had been increased tenfold, to $5,000,000. The bonds with which the Edison Company stockholders were paid sell to-day at 121 or a valuation in addition to the mortgage on the Edison property of more than $6,000,000.

The press dispatch from Baltimore that the Westinghouse Air Brake Company had acquired control of the Brush Electric Light Company of that city is now stated to be entirely without foundation. The Westinghouse Electric Company, which owns a controlling interest in the shares, has recently purchased nearly all of the outstanding special mortgage bonds at 50 cents on the dollar, with a view to so reducing the fixed charges of the company that it will be enabled to pay dividends on its common stock and carry forward needed extensions.

The Baltimore & Northern Electric Railway Company of Baltimore, backed by a syndicate of New York, Philadelphia and Baltimore capitalists, has purchased the Baltimore City Passenger Railway, paying, it is alleged, $90 a share for the 14,000 shares, which were issued at a par value of $25. The stock has paid 10 per cent. for several years. The deal was consummated on the 9th inst. For several weeks the Consolidated Railway Company of Baltimore, the only competitor of the City Passenger Railway, had been negotiating for the purchase of the latter company, but their offer of $85 per share was outbid by the Baltimore & Northern.

Of the sale of the Lindell systems in St. Louis the "Globe-Democrat" of that city gives the following details: "It was decided that not less than $160 was to be taken for the Lindell stock, and not less than $182 for that of the Missouri Railroad Company. The purchase price paid is on the basis of $174 a share for the Lindell stock and $192 for the Missouri. These prices are higher than were ever paid for the stocks in the open market, and were secured only after Mr. Whitaker, Capt. H. C. Haarstick and C. D. McClure, who visited New York as a special committee, convinced the prospective purchasers of the splendid condition and undoubted value of the property of the two roads."

Holders of New Orleans Traction Company securities are notified to deposit them with the Continental Trust Company of New York under the committee's plan of reconstruction. Two dollars per share on the preferred stock and one dollar on the common stock is payable at the time of deposit. After January 10 the right to participate is forfeited. Under the reorganization plan bonds to the amount of $6,141,800 will be issued, $3,000,000 being first mortgage bonds, bearing 4 per cent. for five years and 5 per cent. thereafter. The plan provides for the union in one company of the New Orleans City & Lake Railroad, the Crescent City Railroad and the New Orleans Traction Company. This it is believed will give the company important advantages, both in enabling greater economy in the operation and more compact management and control generally, as well as by creating a better market for the securities of the reorganized company.

On Saturday last a statement attributed to John D. Crimmins appeared in the daily papers, announcing that William C. Whitney and his associates in the ownership of the Metropolitan Street Railway had succeeded in getting control of nearly all the electric lighting and subway interests in New York City, including the Edison Illuminating Company, the Mount Morris Electric Company and the Empire Subway Company. The statement was given with such detail that it was generally accepted as correct, and so it turns out to be, with the exception that the great Edison lighting company was not included in the deal. The motive of the enterprising financiers who are named in connection with this new acquisition is a subject of much conjecture; there is evidently more in it than appears on the surface, but for the present the public must be satisfied with the following explanation from Mr. Whitney which appears in the Sunday "Times." In reference to the published report Mr. Whitney says: "The affair has been greatly exaggerated. Of course I have for a long time been greatly interested in the affairs and working for the prosperity of the Metropolitan Traction Company. An attempt has been made to sell what power this company can furnish which is now not in use. With this end in view the Mount Morris Electric Company has been bought, as well as the control of two or three smaller companies. We have also purchased the subways. This much I will say, but more I cannot divulge at present. Heretofore I have declined to talk at all regarding this affair. I will add, however, that this enterprise will not include the furnishing of light. We cannot enter into that." It is now believed that the Whitney syndicate is the power behind the New York Gas & Electric Light, Heat & Power Company, incorporated a few weeks ago at Albany with a capital of $25,000,000.

EDITORIAL NOTES.

Christmas. It is scarcely necessary to have chanted in our ears the stereotyped cry of "Christmas is coming and turkeys are fat; please drop a nickel in the newsboy's hat" to be reminded that to many the brightest and happiest day of the whole year is at hand. Even to those who have passed the meridian of life the pulse beats a shade faster at the mention of "Christmas," bringing back as it does memories that enhance the value of existence. To the young the day is one of unrestrained joy and good cheer; to the old, one of cordiality and thankfulness. And there is certainly much for which to give thanks this Christmas of 1898. Since the bells chimed forth the coming of Christmas day, 1897, one of the most eventful years in the history of this nation has come and gone. We have been engaged in a war from which we have emerged with honor and glory and with many square miles of new territory. A treaty of peace has lately been signed, which act again places us on a friendly footing with the nations of the world.

The business outlook would seem to be more promising than it has been for some time, and although the electrical industry has possibly not been quite so prosperous as might be desired, there is much for which to be thankful.

We wish all our readers, patrons, friends, a merry Christmas and many of them.

* * *

Elevator Accidents and Elevator Men. The recent deplorable elevator accident in which a well-known member of a New York fire insurance company was killed and several other persons seriously injured again brings up the question as to why such accidents are of such frequent occurrence in New York City. In the case in question it was stated that the accident was due to the automatic stop on the motor which operates the elevator not being properly set. Several hours previous to the accident this very elevator had been carefully examined by an inspector of the Building Department, and he had immediately reported, so it is stated, to the janitor that the stop was not properly adjusted, and yet in spite of this fact the elevator was kept in service. In the report submitted as to the cause of the accident it is further claimed that the operator failed to properly judge the distance to the ground floor. The car accordingly struck the bumper at the bottom of the shaft causing the back-draw weights to raise the car weights, thus tipping the latter into the elevator shaft. "Had the automatic stop on the motor been properly set for the down trip," says the report, "and had the car been properly stopped at the ground floor, the accident would not have happened." As near as we can see, both of the above conditions could readily have been fulfilled by the exercise of an ordinary amount of care. If, as the report states, the janitor of the building was notified that the elevator was out of order, it was his place and duty to discontinue the running of that elevator until it was put in repair. This tendency of running an elevator in which there is a piece of defective machinery, and thus unnecessarily risking the lives of the passengers cannot be too strongly condemned. As to why the elevator was not stopped at the proper time is another matter, and comes under the head of inefficient help, a subject on which we have animadverted time and again. The man who was in charge of the elevator at the time of the accident was from all accounts not the regular operator, but a substitute, and according to a statement made by a gentleman who was an eye-witness of the catastrophe, he (the elevator man) was more or less unfamiliar with the apparatus. Now, as we have stated many times before, life is too precious to be entrusted to ignoramuses. For this reason about a year ago, when the Building Department announced that all elevator men must pass an examination before being allowed to run elevators in this city, we applauded the step as being a movement in the right direction. The examination was held as scheduled, but unfortunately for the public it turned out to be scarcely more than a farce. To illustrate our meaning, here is a sample of the most important questions asked: "Name, age and residence? How long have you been running elevators? What make of elevators have you run? Where are you running now? What make of machine is it and how many are there? What is the carrying capacity of the car? How long are you on the car each day? Have you any other occupation? From whom do you take orders?"

A man answering the above "practical" questions in a satisfactory manner was then granted a license and entrusted with the lives of probably several hundred persons a day. It was apparently deemed unnecessary for an elevator man to know what the effect would be on the machinery were the lever thrown over too suddenly or the rope yanked too hard. As we have stated in previous editorials, however, although in many cases the employes in charge of the apparatus are directly responsible for the accidents, those who deserve the greater censure are the agents or even owners of the buildings, who, with a view to keeping down expenses, invariably seek cheap labor at the possible expense of human lives.

The Aims of the New York Gas & Electric Light, Heat & Power Co.

It must be apparent to every one that this is an era of large financial undertakings. About two months ago, or when the New York Gas & Electric Light, Heat & Power Company, with its $25,000,000 capital, was incorporated, we stated editorially that it was our opinion that the Metropolitan Street Railway Company was either directly or indirectly connected with the project, and from the information that has recently come to light it seems that we were not far out of the way in our surmise. Several of those interested in this new lighting project, as is now generally known, are closely identified with the Metropolitan Street Railway Company, and this will inevitably result in making the interests of these two mammoth corporations almost identical. The object apparently of the New York Gas & Electric Light, Heat & Power Company is to buy in or absorb the several lighting companies now operating in New York City and thus control the furnishing of electricity for lighting and power purposes. With this end in view the syndicate is said to have obtained control of the Consolidated Telegraph and Electrical Subway Company and of the Empire City Subway Company. Thus one of the principal difficulties which have heretofore stood in the way of new lighting and telephone companies, that of obtaining ducts wherein to run cables, has apparently been overcome. In the matter of obtaining control of the several lighting companies now doing business in New York City, the Whitney syndicate, as it is termed, has as yet not met with quite so much success, if general reports are to be credited. According to the latest information, what is known as the Mount Morris Electric Company has been absorbed, as well as several smaller companies, including, so it is thought, the Black Electric Light Company, which organization possesses a charter of considerable value; but the Westinghouse and the Edison electric lighting companies are holding out and refuse to sell. With these two companies out of the proposed light and heat trust, the lower end of the city will still be open to the keenest competition.

As near as can be gathered at the present time, and from statements that have been made, the plan of the New York Gas & Electric Light, Heat & Power Company is to purchase the surplus energy of the Metropolitan Street Railway Company's new plant and dispose of it to consumers. This plant, as is now generally known, will have a capacity of 70,000 horse power, of which probably the total output will be required but a few hours a day for operating the street railway systems. During the hours of light traffic the surplus current could be sold for heating, cooking or lighting purposes, which it is claimed is what will be done, the Whitney syndicate having obtained control of the subway companies as well as several lighting companies with this object in view. From the fact however that the New York Gas & Electric Light, Heat & Power Company but a few days ago purchased a block of land in the neighborhood of the Metropolitan Street Railway Company's power house, it would seem as though the new syndicate proposes to erect a plant of its own and generate current for lighting purposes far in excess of what could be purchased from the street railway company. In fact it is rather difficult to see how any very great amount of surplus current could be obtained from the Metropolitan Street Railway Company for lighting purposes owing to the heavy demand for operating the cars at about the time current would be required for lighting.

It may however interest some of our readers to know that, providing the new light and heat trust succeeds in monopolizing the electric lighting business throughout New York City, it will have a patronage amounting to about $3,000,000 a year, as this is the sum the electric lights are said annually to cost. It would seem after all as though the success of the undertaking would depend to a large extent on the favor of the city administration, as there is a law, if we are not mistaken, which permits the Sinking Fund Commission of New York City to purchase the subways at a price not exceeding 10 per cent. of the original cost.

* * *

The Lighting of New York City.

A number of accidents, due either directly or indirectly to the use of gas for lighting purposes, have been reported lately. A short time ago, owing to the escape of gas in the basement of the Capitol at Washington, an explosion occurred resulting in $20,000 damage. Fortunately no lives were lost, and with the exception of a few valuable reports destroyed everything can readily be replaced. Still more recently a fire broke out in a building on Broadway, New York, which resulted in the loss of several hundred thousand dollars, and was attributed, whether rightly or wrongly, to an explosion of gas in the cellar. Late in the afternoon of December 13 a new gas tank in course of erection for the Consolidated Gas Company collapsed while being subjected to a hydrostatic test, resulting in the death of at least six persons and the injuring of a score of others. Several buildings in the immediate neighborhood of the accident were totally demolished, and it is safe to say that the damage in this case will amount to several hundred thousand dollars. One or more of the supply mains were broken or choked up by the fall of the tank, resulting in the shutting off of the Consolidated Company's supply below Grand street in a part of the city where night work is most common. As this company furnishes most of the gas for lighting purposes in the lower part of the city, the latter was almost in total darkness, which served to reveal as probably never before how dependent the city is on the supply of gas for illuminating its streets. Excepting on a few of the principal thoroughfares electric lights were few and far between, which only goes to show how little after all electricity is being utilized for street lighting, at least in the business portion of the metropolis. It has been stated that the cost of electric lights for lighting the streets of New York City alone amounts to over $2,000 a night, and this being the fact, it is hard to realize it in view of the darkness into which a large portion of the city was plunged on the night of the 13th inst.

Among the down town business houses those which suffered the most through the accident to the Consolidated Company's mains were unquestionably the printing and publishing concerns. In many of these offices gas alone was made use of, which in a number of cases necessitated the leaving of important work undone or doing it with difficulty by improvised means. Accidents such as that of the 13th inst. are fortunately of rare occurrence, although the same results might be brought about at any time throughout the down town districts simply by a break in any of the principal mains. The knowledge of this fact and the experience recently gained would seem to emphasize the advisability of making use of electricity to a greater extent for lighting purposes. About the only accident which can befall a central power station and oblige it to shut down entirely is a conflagration, and even in such an event, which actually occurred in Newark a year or so ago, the street lights were again burning in less time than in the case of the recent deplorable gas accident in this city.

Another serious gas explosion has just been reported from Poughkeepsie, N. Y., in which at least two men lost their lives and an immense amount of damage was done. If these explosions continue to occur it may be that ordinary illuminating gas will have to be placed in the same category with acetylene gas and liquid acetylene.

Under the Searchlight.

Notes and Comments on Various Topics.

A NEW YORK inventor has discovered something much more serviceable than wireless telegraphy in its present stage of development, to wit, a device that is designed to lend additional charm and significance to the quotation from Young's "Night Thoughts," "tired nature's sweet restorer, balmy sleep"—in reality, an Electrical Bedbug Exterminator. In the last number of the Official Gazette of the Patent Office is recorded the grant of a patent bearing this title, the claims of which are formally set forth as follows:

1. The combination with a bedstead, of one or more pairs of electrical contacts consisting of strips surrounding the bars or framework of the bedstead and insulated from each other, whereby an insect, in traversing the bar or frame in the direction of its length, must necessarily close the circuit between the contacts, and a source of electricity connected with said contacts, substantially as described.

As we read this, the thought struck us that it might have some bearing on the recent boom in electrical schemes in the borough of Manhattan—the purchase of great distributing stations, subways, etc., and the incorporation of a multimillionaire company with electrical connections. May it not be that this was all due to the foreknowledge that such a patent was imminent, and that it would create an immense demand for electric current? What seems to confirm this view is the fact that the projected power stations of the syndicate are all to be located on the East Side, where the new device, from all accounts, ought to find an unlimited field of usefulness.

THE Rev. P. F. Jernegan of sea water gold fame and who is now sojourning in Brussels "for his health," has, so it is rumored, generously condescended to return about one-third of the total sum hypothecated from the Electrolytic Marine Salts Company. What a load this act must have lifted from his conscience?

* * *

SAN FRANCISCO advices state that an attempt at sending messages through space without wires was recently tried in that city and proved eminently successful. The experimenter was Prof. Albert Van der Naillen, who had only recently returned from abroad where he made a careful study of the system invented by Marconi.

* * *

SOME exciting scenes were witnessed at Cardiff, Wales, on an evening in November last, which, as reported in the local paper, almost rival those described in Mr. Bailey's story of an "An Italian's View of a New England Winter" in Mark Twain's "Library of Humor." As soon as one of the new electric lamps was lit, a portion of the pavement near the standard became charged with electricity, and the effect on pedestrians was startling and discomforting. The first victim was a terrier which was sniffing round. When it came in contact with the current, the dog gave a wild yelp, sprang into the air, and then scampered away squealing, with its tail drawn in. Next came an old lady carrying a parcel. When opposite the lamp she screamed with fright, dropped the parcel and hobbled off to examine her knees. A coal trimmer of unsteady gait followed, and on receiving the shock he stood still, and as his legs seemed to be getting on fire, he turned round in a dazed way, and went for the youngsters who were standing round laughing at what had now become a game for onlookers. A man lame with rheumatism leaped high into the air, and a smartly dressed young man knelt down to see what had happened to his foot, and as his knee received a shock, he sprang up and hurried away. By this time the workmen found that something was wrong, and the current was switched off.

THE CALORIFIC POWER OF WEATHERED COALS.*

BY R. S. HALE AND HENRY J. WILLIAMS,
Boston, Mass.

In 1896, samples of Maryland, Virginia, Pennsylvania and Ohio coals were collected and arranged for testing as follows: For tests of fine coal, the samples were ground in a coffee grinder, and thoroughly mixed and divided into two parts. For tests of lump coal, the coals were broken into lumps of about nut size, and alternate lumps taken from the pile to form two samples.

Having thus obtained two reliable samples of each coal, or four samples, where tests of both fine and lump coal were to be made, one sample was tightly sealed in an ordinary pint fruit jar, while the corresponding sample was exposed on an uncovered balcony out-of-doors for eleven months in an uncovered tin can provided with a diaphragm or bottom of fine wire gauze.

Rain and snow fell upon the coal, but the wire diaphragm permitted the water to drain off, while a paper disk placed upon the wire gauze prevented the coal from sifting through the meshes.

The percentages of sulphur are found on lines 5 and 6, while lines 7, 8, 9, 10 and 11 give the ultimate analyses, calculated to combustible. The British thermal units calculated from the analyses by the formula suggested by the boiler committee of the A. S. M. E., viz.: "146C + 620 $(H - \frac{O}{8})$ + 40S," appear on line 12, while the British thermal units interpolated from Kent's curve, which is based upon the per cent. of fixed carbon as found by proximate analysis, may be found on line 13.

Line 14 shows the per cent. of fixed carbon in the combustible. Lines 15 to 21 record the changes in the various quantities due to weathering, being plus for an increase and minus for a decrease.

Line 22 gives the free hydrogen, and line 23 its increase and decrease, due to weathering.

Finally, on line 24 the calorific power of three samples of the above coals, both sealed and exposed, as determined in Mr. Williams's bomb calorimeter, is shown.

The average of the results obtained shows that weathering, under the conditions described, decreases the percentage of carbon, hydrogen and nitrogen; increases the percentage of oxygen, and does not materially alter the percentage of sulphur.

When the weathered and unweathered samples are compared.

In a general way, the results show a slight diminution of calorific power in the grades of coal examined, directly traceable to weathering. They also show that where coals have not been exposed to oxidation, by weathering or otherwise, there is a reasonably close agreement between the results calculated by Dulong's formula and those obtained with the bomb calorimeter.

Last of all, they show that when it is desired to compare the respective calorific powers of coals that have been altered to a greater or less extent by oxidation with those of coals that have not been exposed to the weather, the use of Dulong's formula, or any of its modified forms at present in use, as well as the use of Kent's curve, would lead to erroneous conclusions.

The lump samples were exposed in pans of much larger size, which were provided with holes to let the water drain off.

This method of exposure closely reproduces the conditions to which the surface of a pile of coal left out-of-doors would be exposed. The interior of such a pile, however, would suffer less than the samples.

At the end of eleven months all the samples were analyzed by Mr. Henry J. Williams, together with a sample of Pocahontas coal that had been exposed in a coal yard for three years, and one of Cumberland coal that had been under cover for three years. These last coals, however, being different, are not comparable with each other.

The results of the above analyses are shown in the accompanying table.

Proximate analyses of the coals may be found on lines 1, 2, 3 and 4.

In these analyses the percentages of ash in some of the exposed samples are unfortunately too high, for a little gravel was accidentally washed off the roof of the house, by the rain, into some of the cans. This, however, in no way affects the relative percentages of combustible matter, free from ash.

The conclusions to be drawn from an examination of the results shown are:

1st. That weathering decreases by about two per cent. the theoretical calorific power, as calculated by Dulong's formula.

2d. That weathering decreases by about one-half of one per cent. the actual or true calorific power, as shown by the three results obtained with the bomb.

3d. That if the results calculated from the above analyses are interpolated from Kent's curve, which is based on the per cent. of fixed carbon as determined by proximate analysis, the latter being a more or less variable quantity according to the age and degree of exposure of the coal, the remarkable result is obtained that the weathering of a sample of coal *increases* the percentage of fixed carbon in the combustible, and also *increases* by about *one per cent.* the calorific power of the coal.

It may be noted that the English form of Dulong's formula, which neglects the term $\frac{O}{8}$, but uses slightly lower values for the heat of combustion of C and H, would cause the calorific power, as computed, to agree more closely with the results obtained with the bomb than the formula "146C + 620 $(H - \frac{O}{8})$ + 40S." This is especially noticeable

*Presented at the New York meeting (December, 1898) of the American Society of Mechanical Engineers.

Municipal Ownership.

Thomas J. Kelly, president of the Horace Bushnell Sociological Club, delivered an address in Hartford, Conn., a few evenings ago on "Municipal Ownership of Natural Monopolies," taking the ground that municipal ownership of street railways, gas and electric lighting plants and any other natural monopoly was not for the benefit of the community. Mr. Kelly claimed that municipal ownership of gas plants had not been a success in this country, although twelve cities owned or had owned their plants. There is not a city in this country which owns its street railway plant and we are twenty-five years ahead of any country in Europe in the operation of street railways, so no comparison can be made with railways in European cities which own their street railway plants. In Glasgow, Scotland, where the city a few years ago acquired the street railway, it is still operated by horses, and although the fare is but one cent a mile it would cost 71 cents to travel over the 71 miles of track in the city. In Hartford you can travel ten miles for 5 cents. Mr. Kelly quoted the city of Philadelphia among other cities as having given up the municipal ownership of gas plants after fifty years. He claimed that municipal ownership of natural monopolies was simply political monopoly. He said the only proper system of treating the problem was by the sale of the franchise for a period of years to the highest bidder, with an annual tax upon the gross receipts, as prevails in Toronto, where a large income is assured the city from the franchise of the street railway company.

THE CATARACT POWER COMPANY OF HAMILTON.*

Saturday, November 12, will go down in the electrical annals of Canada as a red letter day, as it will chronicle the formal opening of the electric power plant of the Cataract Power Company of Hamilton, Limited, for the transmission of electrical energy from a point on the Niagara escarpment near DeCew Falls to Hamilton, a distance of 35 miles, the conception and carrying out of which must always stand as a monument of business pluck and enterprise on the part of those interested in and forming the Cataract Power Company.

Over three years ago, when the transmission of energy by electricity over long distances for commercial purposes was still in much of an experimental stage, the possibility of utilizing the magnificent fall of over 200 feet obtainable at DeCew Falls, where the waters of the Beaver Dams creek tumble over the Niagara escarpment, for the generation of electrical energy to be transmitted to the city of Hamilton, 35 miles distant, suggested itself to Mr. John Patterson of that city. After numerous surveys and examining into the physical feasibility of the scheme, he associated with himself the Hon J. M. Gibson, John Moodie, Sr., James Dixon and J. W. Sutherland, all well-known citizens of Hamilton. Together they procured a charter and formed the Cataract Power Company of Hamilton, Limited, for the purpose of the development of this power and the transmission of it to Hamilton.

After the formation of the company the ground was again gone over carefully and it was found advisable to abandon the original idea of utilizing the waters and water-ways of the Beaver Dams creek and the De Cew Falls, and by changing the plans some very material advantages were gained:

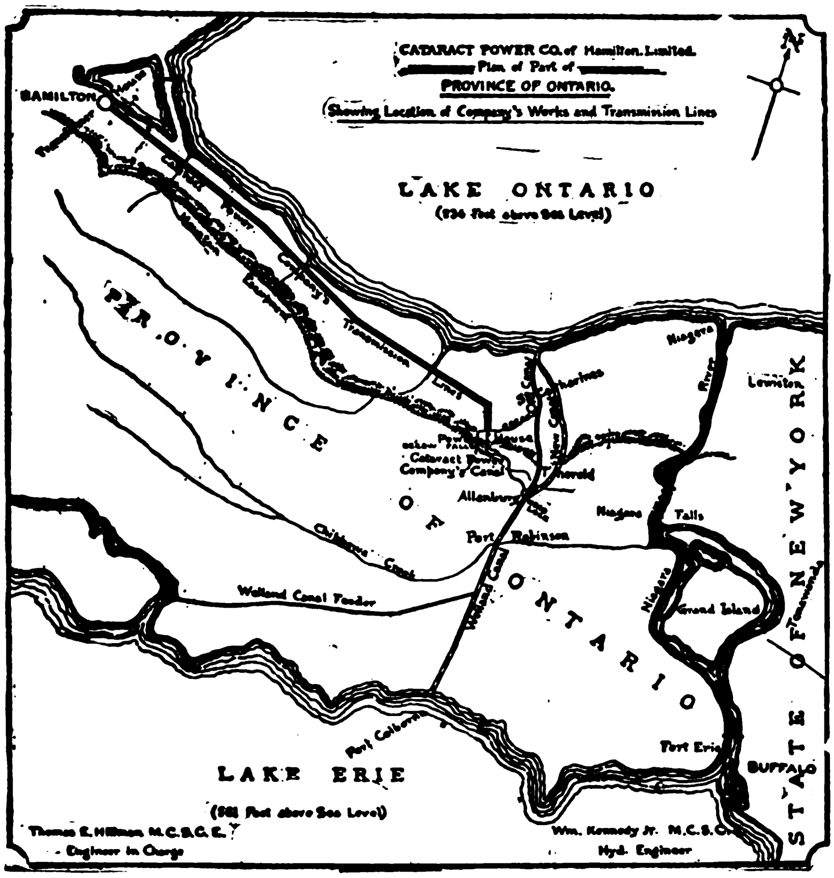
First, the securing of a supply of water which would be constant, through a feed er from the Lake Erie level of the Welland Canal at Allanburg.

Second, the construction of a canal, 4¾ miles long, over private right-of-way, thus giving the company an unobstructed water-way.

Third, the securing of land along the private water-way for storage basins, by which the company can conserve its water at a period of non use or light load for use at the time of heavy load.

Fourth, by going three-quarters of a mile east of De Cew Falls along the Niagara escarpment, an additional fall of 70 feet was obtained, which was a very valuable acquisition. At this point there were also exceptional natural advantages, both at the top of the escarpment for the anchorage of flumes, erection of penstocks, etc., and at the foot of it for the discharge of the tail water, as well as a splendid site for the power house.

The hydraulic development, as it was desired by the Cataract Power Company, presented obstacles which, owing to the large units and to the high head, made it exceptionally difficult to secure a builder of water-wheels who would give what the hydraulic engineer's specifications called for. After a long delay and much negotiation, however, a Dayton, O., concern agreed to build special horizontal turbines of about 2,000 horse power each, to work under a head of 265 feet, and to operate at a speed of 400 revolutions per minute. This required, also, special valve and valve gear and controlling devices, all of which were specially designed for this particular plant.



The generation of the electric power and the transmission of the same from the power house to the city of Hamilton, a distance of 35 miles, presented at that time a seemingly insurmountable obstacle to the carrying out of the scheme, no transmission of energy such a long distance, for commercial purposes, having up to that time been undertaken. The largest electrical concerns, both in Europe and America, were consulted, but the limitation of a practical working pressure, sufficiently great to insure the transmission of power such a long distance, practically precluded the undertaking of the work by many of the companies consulted, the highest working pressure, up to that time, being not above 10,000 volts. At this pressure the cost of the transmission line became so great that the Cataract Power Company did not feel warranted to undertake the development of the enterprise. The longer the distance, the heavier the conductor must be; therefore to transmit over this long distance it was necessary that the pressure be 20,000 volts or over, so that the cost of the conductor would be within the limit set to allow the Cataract Power Company to undertake the development of the enterprise. After nearly a year of futile attempts to have the work undertaken at a pressure which would justify them in proceeding with the work, and being unsuccessful, they consulted Mr. J. A. Kammerer, one of the staff of the Royal Electric Company of Montreal, and after careful consideration of the conditions, and preliminary estimates of cost prepared by him, with a working pressure of 24,000 volts guaranteed, the Royal Electric Company agreed to undertake the work which, with its consequent saving, brought the cost within the limits deemed necessary by the Cataract Power Company to admit of the enterprise being proceeded with.

Ground was first broken on October 5, 1897, and the work pushed with such vigor that the current was sent over the lines from De Cew Falls to Hamilton on the afternoon of August 25, 1898, or just 10 months and 10 days from the beginning of the undertaking.

THE CANAL.

The water for this plant is secured through a feeder from the Lake Erie level of the Welland canal at Allanburg. The arrangement of the gates, is such as to admit of the unwatering of the lower levels of both the old and the new Welland canals without interfering with the company's supply of water.

From Allanburg the company has a private canal extending northwesterly to the edge of the Niagara escarpment, a total distance of about four and one-half miles.

FIG. 1.
Flume over Beaver Dams Creek.

At three different points there are placed gates for regulating or shutting off the supply, so that the water is under complete control. Where the canal crosses the Beaver Dams creek, the water is carried in a closed wooden flume supported on a steel truss. This flume, which is shown in Fig. 1, is placed below the level of the water in the canal at each end so that the contained water is always under pressure, which is intended to prevent leakage. The water follows generally the water courses of a succession of small streams, consequently there are few heavy cuts or fills. In a number of places the contour of the ground formed a natural bed for the canal, and no work was necessary. At the heavy cuttings the banks to the bottom of the canal are pitched with stone, and the important embankments are rip-rapped to prevent erosion.

At the lower end of the canal near the mountain top are located three large storage reservoirs, having a total area of thirty-three acres. Two of these are known as lakes of Moodie & Gibson, the former being shown in Fig. 2. These three reservoirs are sufficient to contain forty-eight hours' supply of water, and will meet the hourly inequalities of demand usual in electric supply companies, as well as allowing the unwatering of the upper stretches of the canal for repair purposes, without the interruption of the company's service. Throughout the whole length the work is of particularly substantial character, the factor of safety being exceptionally large, and the requirements of the service seem to have been carefully considered.

The large reservoirs, being located immediately at the mountain's edge where the water enters a steel pipe, the long stretches of slow current canal will it is expected promptly freeze over and prevent any trouble from frazil or anchor ice. In this mat-

* Abstract from *Canadian Electrical News*.

ter the water power is particularly fortunate, as there is practically dead water to Lake Erie. The canal is designed to carry sufficient water to develop from 10,000 to 12,000 horse power without creating an erosive speed in the current.

THE PIPE.

At the brow of the mountain the water is delivered through a concrete fore bay, protected by suitable racks and head gates, to a large steel pipe which carries it directly down the mountain slope to the power house, 260 feet below. The pipe is of steel plate, double riveted on both longitudinal and transverse seams. It is 745 feet in length and varies in diameter from 8 feet 6 inches at the top to 7 feet 6 inches at the bottom. The steel used for the top section is ½ inch in thickness and gradually increases in size down the slope until at the bottom it is 13-16 of an inch. The weight of this pipe is all supported from the top, where a number of heavy flanges are built into several piers of concrete placed in the rock cutting. Down the slope, at intervals of 15 feet, supporting masonry foundations are constructed. A substantial double housing of matched lumber is now being built over the entire length to protect the pipe from extreme changes of temperature.

About two-thirds of the way down the slope is placed an expansion joint to take care of any elongation or contraction. In addition to serving this purpose the joint is so designed as to support the part of the pipe below it. This is accomplished by means of the water pressure acting against an annular piston attached to the lower section, the piston working in a cylinder attached to the upper section.

From the top the pipe runs downward at an angle of about twenty degrees for about two-thirds of its length, where it reaches a level bench about 60 feet wide and then continues downward at the same slope to the bottom, where it turns with a gentle curve almost a right angle and extends underneath the floor of the power house.

POWER HOUSE.

The power house building (Fig. 3) is a substantial structure of iron and brick, 174 x 42 feet, with a galvanized iron roof over matched board sheathing. It is designed to accommodate four complete generating units and the necessary step-up transformers, switchboard, etc. Only two units and half the capacity in transformers are at present installed. The building is lighted by clusters of incandescent lights and will be heated by electric heaters.

The main supply pipe enters at the end of the building below the floor level, and inside the building widens out into a steel receiver 10 feet in diameter, which is solidly imbedded in concrete underneath the floor. From this receiver four branch pipes come up through the floor with a quarter turn for delivering water to the turbines. In these branch supply pipes are placed large vertical hydraulic gates. These gates are 36″ in diameter, and are operated by hydraulic pressure by means of a four-way valve, controlled by a lever. These valves will open or close in less than a minute. Beyond each gate valve is placed a 12″ spring relief valve, to relieve the pressure when it exceeds that due to the normal static head. The turbines are 1,950 HP. each, and run at 400 revolutions under the normal head of 280 feet.

The water wheels are of the inward flow central discharge reaction type, with cylinder gates. We believe that this is the highest head employing this type of turbine, most of the high head plants using the jet or impulse peripheral bucket design wheels. In order to withstand the unusual pressure, the runners, the gates and all parts susceptible to wear are made of bronze, and everything is made extremely heavy and has been specially designed for this plant. The water enters the wheel horizontally and discharges vertically downward through a draft tube 14 feet in height. Each unit is equipped with an electric governor of the Giessler design for controlling the speed. On the outer end of the shaft is placed a 7½ ton steel fly wheel with an outboard bearing. The combined influence of the enlarged receiver, the relief valves and the heavy fly wheel is calculated to overcome any tendency to water hammer.

ELECTRICAL EQUIPMENT.

The electrical equipment marks a long stride forward in the progress of electrical engineering as applied to transmission of energy. The generators are of the well-known S. K. C. inductor type, generating two-phase current at 2,000 volts, running at 400 revolutions per minute. Each of the two generators at present installed is of 1,000 KW. rated capacity. They are connected direct to the turbine shaft by means of an insulated flexible coupling composed of two flanges with projecting pins, the alternate pins being joined by sole leather links. The generators rest on base frames of seasoned Georgia pine to insulate them from the foundations. The inductors of these machines weigh over twelve tons, which weight running at such a high speed requires most careful workmanship. The entire absence of vibration and general smoothness of operation are certainly creditable to the manufacturers.

The wires connecting the generators to the switchboard are laid in conduits in the floor, which are covered with iron griddles so that they are accessible at any point.

There are two exciters of 30 KW. capacity, each driven by a separate turbine. Each exciter is calculated for supplying the full equipment of four generators. They are likewise directly connected to and insulated from the turbines.

The main switchboard is made up of three white marble panels, one for each generator and one for the exciters. On the generator panels all the connections are made on the back of the board, there being no terminals on the face. The switches are of the S. K. C. slide quick break type and are provided with automatic shutters to prevent arcing. They are double throw, connecting to two separate sets of bus bars so that the machines may be run on separate lines or in parallel, according to the future requirements of the service. Each generator panel contains a voltmeter with a double throw switch connected to both phases, an ampere-meter on each phase and a direct current ampere-meter in the field circuit of the generator. The cases of the instruments are made of ground glass and present a very attractive appearance. The exciter panel contains the usual instruments for operating two shunt wound direct current machines in parallel, and also contains the synchronizer, which is of the ordinary three lamp type.

A special feature is the absence of generator fuses. As the S. K. C. generators supplied were made especially to withstand a heavy overload it was considered safer to risk the strain upon the generators due to a short circuit rather than by the blowing of generator fuses to cause the instant removal of the entire load from the water wheels.

Immediately back of the switchboard and taking up one end of the building are located ten of a new type of S. K. C. transformers, used to raise the potential relieved by the generators to 22,500 volts on the transmission line, at which pressure it is at present operated. These transformers are arranged in batteries of five, each transformer having a capacity of 200 KW. They are artificially cooled by means of water supplied directly from the penstock, the pressure being reduced by means of throttle valves. The transformers are encased in tanks made of steel boiler plates and rest directly on the concrete floor. The coils are wound in sections carefully insulated and separated by unusually large air spaces, and the whole immersed in mineral-seal oil. This construction has been found to admirably answer the purpose of this exceedingly high voltage, each transformer being tested with a break down strain of 40,000 volts before being installed.

A novel feature of the installation is the switchboards, which accompany each transformer. They are of specially selected white marble and contain two single pole high voltage switches and one double pole 2,000 volt switch, the two high voltages being separated by a marble barrier. The high voltage switches consist of a flexible cable, having a screw plug attached to one end and a socket to the other, the socket being attached to a hardwood pole four feet in length for safe handling. The socket and the plug which it fits over are tipped with non-arcing metal. By means of these specially constructed switches the 22,500 volt circuit can readily be opened. The low voltage switches are of the S. K. C. slide quick break type on the back of the switchboard. Each transformer is also equipped on both the primary and secondary sides with enclosed non-arcing fuses. The 22,500 volt wires inside the building are all covered with a specially heavy insulation of rubber and are supported on porcelain line insulators on an overhead rack, all being in plain sight and easily accessible.

From the transformers, which are connected five in parallel on each phase, the circuit runs to the line terminal board, consisting of four high voltage switches similar to those placed on the transformer, except that they have double terminals, in order that they may be changed to either of the two lines contemplated by the company. Immediately above the line terminal board is placed a specially constructed lightning arrester equipment composed of 60 S. K. C. non-arcing arresters with their special appurtenances and connections. From the lightning arresters the wires pass upward and out through the wall of the building at a height about 30 feet from the floor.

THE TRANSMISSION LINE.

The high voltage wires are carried through the brick wall forming the gable of the power house, by means of lead-encased rubber-covered cables, protected by vitrified pipe, the cable being kept clear

FIG. 2.—STORAGE RESERVOIR NO. 1, LAKE MOODIE.

of the pipe by wooden bushings specially prepared in oil. After passing over a cross-arm attached to the building, the lead-covered cable is joined to the bare copper transmission wires by means of a long, carefully made water-proof joint. This special construction has proven entirely satisfactory.

From the power house the transmission line crosses the Twelve Mile creek and runs up the hill opposite on private property to a concession road, thence along this roadway due north to the Grand Trunk Railway and then westward along the railroad right of way on an almost perfectly straight line to the company's step-down station at Hamilton, a total distance of a little less than 34 miles. The transmission wires are four in number, and are No. 1 B. & S. medium drawn bare copper. They are all placed on one four pin cross-arm 3¾ x 5¾", spaced 18" apart, and are supported on porcelain insulators of the Redlands type. The pins are of special design, holding the insulator two inches higher from the

FIG. 3.—GENERAL VIEW OF POWER HOUSE AND PIPE.

cross-arm than the standard practice. This is to avoid trouble from heavy snow or sleet. The pins are of yellow locust specially prepared in oil, and are fastened into the cross-arm with a wooden pin instead of being nailed, so as to use as little iron as possible.

The poles are all specially selected, with 8" tops and not less than 35 feet in length. They are set 90 feet apart and 6 feet deep in the earth. The height of the poles varies with the contour of the ground, so as to keep the wires as nearly horizontal as possible. In marshy places a crib filled with stone is built around the base of the pole, and where the line crosses the Jordan river the poles are placed in a cluster of piles specially driven for the purpose. On the top of the poles is run a galvanized iron barb wire grounded at every pole by means of an iron plate for lightning protection. Below the transmission cross-arm is placed a two-pin cross-arm carrying the telephone circuit.

The telephone circuit is a complete metallic circuit of No. 10 B. W. G. galvanized wire, transposed at every fifth pole. This arrangement has been found to give satisfactory service with the heaviest currents yet passed over the line.

The insulators were all carefully tested with a break-down pressure of 60,000 volts, both at the factory and again at Hamilton, before being put up, with the satisfactory result that not one has broken down or produced the slightest trouble in the three months during which the line has been in operation, notwithstanding the unusual rain and sleet storms during that period.

TRANSFORMER SUB-STATION AT HAMILTON.

The company's step-down station is located on Victoria avenue, immediately beside the Grand Trunk Railway's right of way, about one mile within the city limits. It is a neat structure, built of brick with a slate roof and specially designed for its purpose. At this point the voltage is reduced to 2,000 volts at which pressure the current is distributed through the city in four separate circuits.

The line wires are carried through the brick walls of the building in the same manner as at the power house. There is the same arrangement of lightning arresters, high voltage lines and two batteries of transformers. The transformers, however, are arranged so as to be artificially cooled at times of heavy load by an air blast. The transformers rest over an air duct in the floor and are provided with a ring of vertical air ducts passing up through the oil. The blast arrangement, which consists of a No. 6 Sturtevant blower, direct connected to an S. K. C. two phase induction motor, delivers air directly into this duct which then passes upward through the transformers.

In the transformer room is also placed the distribution switchboard, and, as at the power house, only half the ultimate capacity of the transformers has been installed, the building being designed to accommodate two more batteries of five, similar to those already placed, consisting of four panels each, containing two ampere-meters, two double pole double-throw switches and four duplex fuse blocks. From this distribution switchboard incandescent lighting current is supplied for the Hamilton Electric Light & Power Company, as well as for motors on premises of customers throughout the city. From the switchboard the circuit wires pass upward to a cupola in the roof, at which point they are joined to the distribution circuits. The line supplying the incandescent service is a four-wire two-phase circuit, but the circuits devoted exclusively to power are composed of three wires only.

At the premises of the Hamilton Electric Light & Power Company is being installed a new circuit switchboard, arranged to accommodate the old single-phase lighting circuits of this company. Each circuit is equipped with a double-throw switch in order that the load may be divided with a regulating transformer, so that the pressure may be controlled upon this point. The old house-to-house 1,000 volt 16,000 alternation transformers have all been replaced by new S. K. C. 2,000 volt 8,000 alternation transformers in larger units, and the service all changed to this higher pressure in order to reduce the losses and obtain better regulation.

In addition to supplying the Hamilton Electric Light & Power Company's service, the Cataract Power Company have already contracted for a large amount of power for operating factories of different kinds in the city. They expect within a short time to supply the various electric railways in and about Hamilton and to replace many of the steam engines in the various manufacturing establishments with electric motors.

The plant has been in practical operation for several months, and has thoroughly demonstrated the success of electrical transmission at this high voltage and long distance, which speaks well for the carefulness in designing and construction of the work.

ELECTRICITY IN THE WAR.*

The lessons taught by the late war with respect to the employment of electricity aboard men-of-war are few in number, though important in their bearing. The most decisive result was the demonstration of the immense superiority of electricity over steam for the operation of turret-training apparatus —a demonstration so decisive, in fact, that the question of the employment of electric power for this purpose is no longer an open one. The Society is to be congratulated that one of its members is the inventor of the system whose application has led to this happy result. I refer to Mr. H. Ward Leonard.

Another question which the test of battle has settled definitely is the superiority of electric ammunition hoists, not only in efficiency in working, but in a convenience with respect to location and space occupied that will tend to greatly extend the application of electric power on shipboard generally.

Against the great success in the particulars just mentioned must be set the failure of electrical range-finding apparatus, and of electrical indicating apparatus in general. As to the first mentioned, the enemy gave so few opportunities for its use, and even then so little necessity existed for its employment in view of the leisurely manner in which our vessels could pick up their range, that possibly neglect had something to do in the case.

At any rate, electrical range-finding should not be condemned in general because of the failure of a single system. In fact the weak points in the one in question would seem to be easily overcome by the employment of alternating currents of high frequency and considerable voltage, thereby enabling a drop between indicating points to be obtained by means of inductance which would be in the order of volts instead of possibly millivolts as where the direct current is used. I will add that an apparatus somewhat answering this description has been proposed by Messrs. Crehore and Squier.

As to other indicating apparatus, it should be borne in mind that electrical apparatus of this nature requires a certain amount of expert care which it is not always possible to obtain aboard ship, while the contrary is the case with the mechanical apparatus that it would displace. If in anticipation of battle the latter is thoroughly overhauled, as would be the case, there is more assurance of its efficient working than electrical apparatus under the adverse condition named, notwithstanding the inherent superiority of the latter. This brings up the question of the deficiency aboard ship of necessary electrical skill, which has been made the subject of an official report by the bureau officer in charge of electrical engineering, and will be referred to later on.

The favorable experience with electric power in the important cases just mentioned should accelerate the extension of its application aboard ship, and while, unfortunately, the present bureaucratic tendency is not in that direction, I shall nevertheless refer to some other cases distinctly calling for such application.

The one of immediate importance, and which in fact can be considered a crying necessity, is that of electric ventilation.

For warship ventilation, both with respect to coal economy and deriving the most efficient results in ventilation itself, the electric fan offers an ideal solution. The modern warship being divided into numerous compartments, each of these can be supplied with its own electric fan or fans, either for isolated ventilation or to supply a system of only such extent as will involve no sacrifice in efficient ventilation. The type of engine now employed with steam ventilators undoubtedly requires anywhere from 75 to 200 pounds, and even more water per horse-power hour. In the case of a large electric plant and with

* An address by W. D. Weaver, late Chief Engineer of U. S. S. Glacier, before the New York Electrical Society, Dec. 14, 1898, on "Electrical and Engineering Work in the Navy during the War."

fan motors of the most ordinary efficiency, this would be reduced to considerably below 50 pounds, while at the same time the ventilation for a given expenditure of power would be greatly increased in efficiency.

Whether electricity should be applied to furnace blowers for forced draught is an open question at the present moment, in view of the very infrequent use of such blowers and consequent large idle electric plant normally that would be entailed.

Other employments of electric power so obvious that their adoption cannot be greatly delayed, are in driving the workshop and ice machine now installed aboard every warship. The engines of the latter are particularly inefficient, aside from their immense inconvenience through the heat given forth. In these cases the application of the electric motor is so simple that it cannot be open to question, and the same remark applies to winches and ash hoists. On the ship of which I was chief engineer there were six of these, which I estimated consumed steam at the rate of over 150 pounds per horse-power hour, not counting the great condensation in the long lengths of steam-supply pipes.

Steam pumps are, as is well known, grossly inefficient in steam consumption, and the same is true to a lesser extent of other auxiliary machinery connected with the propelling engines. While it may be claimed that it would be inadvisable to render the operation of the propelling machinery, particularly in time of battle or during storms, dependent on obtaining power from the electric mains, in reply it may be said that the number of different engines at present employed to run the auxiliary machinery is in itself a great hazard, for the breaking down of almost any one would alone affect the operation of the main propelling machinery.

Among other probable applications of electricity in the future are to anchor hoists and steering gear. The navy has had a somewhat unfortunate experience with the latter, and this, by the way, carries a lesson with it for those interested in introducing new electrical machinery aboard warships.

The lesson is, that in every case possible such machinery should first be tried aboard merchantmen and all experimental work entirely completed before attempting to secure adoption by the navy. In many cases it would possibly not be a difficult matter to find opportunities for making the trial on coastwise or freight steamers, or on harbor vessels, though sometimes, however, at the expense of those putting the apparatus aboard.

Steering gear and anchor hoists now furnish good subjects for the electrical designer, and if previously tested in the manner described would undoubtedly stand an excellent chance of adoption for use in the navy in the near future.

As I have intimated, it must be reluctantly acknowledged that, notwithstanding the extremely efficient showing electricity made during the late war, it is apparently at the present moment not in high favor at the Navy Department. The Chief of the Bureau having charge of electrical matters has recently reported very gloomily concerning the difficulty experienced aboard ship in keeping the generating plant in an efficient state; and the Naval Board of Construction has refused to further extend the application of electricity on shipboard, the decision being that the use of electricity has gone far enough for the present.

It is quite probable that this unfortunate decision was arrived at owing to the unfavorable condition referred to concerning efficient operation. Why the operation of an electric plant of the size installed aboard ship should present any considerable difficulty will probably be a puzzle to those here present who are conversant with electrical operation ashore, as it would also to those familiar with merchant ship electric lighting. The clue is given, however, in a remark by the Bureau Chief as to the difficulty met with in obtaining an efficient operating force, the fault thus lying, it is to be surmised, not with the electrical apparatus, but with the electrical personnel.

In view of the manner in which professional pride and the electrical industry are thus affected, it would appear entirely appropriate for the electrical fraternity to use its influence to have the appropriate remedy applied to the serious defect which has thus been officially acknowledged to exist. What this remedy should be might well prove the subject of a Departmental or even of a Congressional investigation. That it is due to a faulty system, and not chargeable to lack of zeal on the part of the officers affected, can, I believe, be taken for granted.

NEW SCHEDULE FOR NIAGARA POWER.*

The Cataract Power & Conduit Company will, it is understood, about the first of the New Year, promulgate a new schedule of rates which will be more favorable to the user of power than the one now in vogue, which was announced last April. It should be stated here that the officers of the company decline to confirm this statement and it is given without their authority. It will readily be understood that the company will announce its new and reduced schedule when it gets ready, and not before.

The reason why a new schedule will be inaugurated is plain. There is a great deal more power ready and waiting for delivery in Buffalo than there was a few months ago, and there has been a constant improvement in the facilities for delivery. With all the facilities completed both at Niagara Falls, the seat of the power, and in Buffalo, for distribution of the same, and a transmission line capable of carrying some thousands more horse-power than is now in use here, it stands to reason that the big company which produces the power and the local company whose province it is to distribute it will come to an understanding in the direction of cheaper rates. After all the vast machines, shafts, canals, power houses, transmission lines, conduits, distributing stations and other needed paraphernalia are established, so that the water of the great cataract will do the rest, there will naturally come a desire on the part of the power people to market their product. The way to make a market for all of it is clearly to offer such inducements that other forms of power will not be in the race. This will be done. The arrangements have proceeded quietly and without ostentation, but Niagara power will be the great power of the world. There are other cataracts and other electric power plants, but there is only one Niagara. There is only one great city that has any such advantage as Buffalo—only one combination of practically unlimited cheap power and shipping facilities equal to the best on earth.

POWER NOW USED IN BUFFALO.

The motors already installed in Buffalo have an aggregate capacity of about 4,500 horse-power. They include: Buffalo Railway Company, 2,000 horse-power; Great Northern Elevator, 1,200 horse-power; Union Dry Dock, 485 horse-power; Electric Elevator, 475 horse-power; Curtiss' Malthouse, 300 horse-power. Besides this it is estimated that the Buffalo General Electric Company will use 3,000 horse-power. It is already using 400 or 500 horse-power and the change is gradually being made which increases the amount used. The Urban Milling Company will use 300 horse-power and the machinery for this purpose will be in place in three or four weeks. A contract has been made with the McKinnin Dash Company for 100 horse-power, and negotiations are under way for further contracts. The Cataract Power & Conduit Company could furnish at this time 10,000 horse-power and by January 1 it will be able to provide 15,000 horse-power. It will be seen from the figures given that the amount of power actually in use and contracted for is about 7,900 horse-power.

HOW THE CURRENT IS HANDLED.

The electric current from Niagara Falls is received at the transformer stations in Seventh street, adjoining the General Electric Company's new Wilkeson street plant, at 10,000 volts three-phase current. There are duplicate circuits, so if an emergency comes where one fails another can be used. The current goes through switchboards and then to transformers, which reduce the current to a pressure of 370 volts, still three phase. Next the electric energy comes into the General Electric Company's building on very heavy copper cables, and thence is distributed to motors which are directly connected to generators of various types. Some of the generators are used in street lighting, some are for incandescent lighting and others for supplying 500-volt power for small factories, for motors up to 50 or 60 horse-power.

This power will be distributed all over the city at the usual pressures the company has been utilizing and in a similar manner, so the motors used for Niagara power will simply take the place of engines and boilers, the power itself not being suitable for lighting, but only for motive power.

All the remaining cables needed by the Cataract Power & Conduit Company are ready to be shipped. They will be connected with the different transportation stations. One important piece of machinery needed by the company arrived the first of this month —13 months after it was ordered. It takes time to install a new plant of this magnitude.

The present schedule of rates of the Niagara Power & Conduit Company makes the power cost $22.35 per horse-power per year, supposing the consumer uses 80 horse-power. It is the cheapest power in the world and the most desirable. Cheap power combined with the wonderful shipping advantages of Buffalo will build up a vast manufacturing city here unless there is some strange and undue counteracting influence to work to Buffalo's detriment. There are 35,000,000 people within a night's ride of this city. Following is the distributing company's schedule of the rates. The figures are given on a basis of 10 hour use:

PRESENT RATES FOR POWER.

2,200 volt alternating current delivered on the premises of customer.

The unit is the kilowatt-hour equivalent to 1 1-3 horse power hour.

Service charge for maximum power called for per month, $1 per unit or kilowatt. Equals $0.75 per horse power.

Additional charge by meter:

For 1,000 units or less per month, $0.02 per unit.
For excess over 1,000 up to 2,000 units, $0.015 per unit.
For excess over 2,000 up to 3,000 units, $0.012 per unit.
For excess over 3,000 up to 5,000 units, $0.01 per unit.
For excess over 5,000 up to 10,000 units, $0.008 per unit.
For excess over 10,000 up to 20,000 units, $0.0075 per unit.
For excess over 20,000 up to 40,000 units, $0.007 per unit.
For excess over 40,000 up to 80,000 units, $0.0066 per unit.
For excess over 80,000 units, $0.0061 per unit.

Example—An 80-horse-power motor running ten hours per day, taking 80 horse power at times as a maximum but averaging throughout the day about 60 horse power, would in 25 days per month consume current as follows: 60 x 10 x 25—15,000 horse-power hours, or reduced to units, 15,000 x 746-1,000—11,200 units.

The charge per month for this by the above table would be made up as follows:

Charge for service demand of 80 horse power, at $0.75	$60
Charge for power, 10,000 units, at $0.008	80
1,200 units, excess over 10,000 at $0.0075	9
Total charge per month	$149

As usually calculated by the consumer, dividing the total operating expense by rated horse power this charge is equivalent to $22.35 per horse power per annum.

*From the Buffalo *Times*, Dec. 11, 1898.

ADEQUATE FIRE PROTECTION FOR HIGH BUILDINGS.

The following article by Mr. Jean A. Wetmore, of Brooklyn, is rather unique in its way, but as it contains several suggestions worthy of note we give it space:

A fire lately occurred on Broadway involving an old-style low building and a modern fireproof sky-scraper. The Fire Department sent rattling along its antiquated paraphernalia, but on account of a high wind it was unable to control the fire in the low building, and because some inspectors were delinquent in their duties in not having the sky-scraper provided with fireproof window shutters, the latter caught and burned out the interior of its upper stories. The fire chief did the best he could with his liliputian apparatus. His little steam squirt guns on wheels puffed and snorted; his Siamese pipe-stem of a perambulating water tower could not be lengthened seventeen stories high, and so he called more funny little squirters and towers to his aid. But all the chief's horses and all the chief's men could not effectually squirt higher than nine stories. The chief saw the ridiculousness of his primitive efforts, for he is quoted as saying: "Let her burn, boys!" An extended conflagration might have ensued as far as the department was concerned had not the fireproof structure stood like a mighty bulwark and fire-wall to protect what was beyond.

Old-method "authorities" now tell us a law should be passed prohibiting buildings from being over a certain limited height in New York—all because the Fire Department's apparatus has not kept step with the changed modern building construction. . . .

All experienced traveling men know that a fast express train is safer than traveling on an accommodation or a freight train, and for much the same reason a sky-scraper is safer on account of the great skill and the best of material used in construction.

Whoever heard of the necessity of shoring up one of these buildings to keep it from tumbling down like the low, flat Rothschild building in Brooklyn.

Instead of laws limiting the height of buildings, called for by the New York and Philadelphia fire chiefs, we should require laws compelling the building of nothing but sky-scrapers along the blocks facing Broadway, in the place of the low buildings that are the true sources of conflagration.

Whoever heard of a serious fire originating in a sky-scraper?

Two parallel blocks of rows of sky-scrapers from the Battery to the Harlem River would prove an efficient fire-wall, extending along the backbone of Manhattan Island, to prevent an extended conflagration in a high wind, such as devastated Chicago before they were built in that city.

The more twenty-five and forty-story buildings the better; blow up the old rathole firetraps that disgrace our main thoroughfare, and allow us to become a representative modern city. . . .

The next problem to be solved is to make each sky-scraper its own stationary water tower for its individual purposes and also to drown out fires in surrounding buildings, even those across the street, and to water-soak any insignificant tinderbox structure that may be on fire below.

Then construct permanent stationary means to conduct plenty of water to each building, independent of the present over-taxed water system, and then provide means to get the water to the place with sufficient force.

To Western people the solution of these problems would be simple, easy and quick of practical solution. But to the old fogy mossbacks and time-servers in charge of our Eastern municipal departments, I doubt the possibility of the change unless we place the ideas on their heads and drive them clear through their cobwebby intellects with an axe; for their only originality consists in pulling down the buildings that are the pride of our city, in order to bring their roofs within the reach of their groveling intellects and their little puffy old steam squirt-guns.

The tall buildings of Western cities are provided with two or more stand-pipes reaching through to their roofs, to which two or more engines may be attached to each pipe when necessary, and the water pumped in solid unbroken streams, unaffected by prevailing winds, to any desired height; and in certain sections of those cities hose carts do not accompany an engine.

Other cities, like Detroit, have laid underground conduits from the river, independent of the usual water supply system, and a powerful fire-boat forces the water to the desired locality, and may be operated, if desired, in conjunction with the stationary stand-pipe, with or without the assistance of the usual fire engine.

Few of our buildings are provided with accessible stand-pipes, and we are unable to avail ourselves of the admirable river fire-boats for inland purposes. Our only auxiliary to the toy fire engines is a water tank on the roof that seldom, if ever, is full, or holds enough water, or gives adequate pressure where and when most needed; or a pumping apparatus in the basement, that is of little use on account of the time to get it in operation, or is of sufficient capacity. Both of these aids practice has shown are quite impracticable and unreliable.

There is probably no city in the world so admirably situated as New York for adequate fire service to meet modern requirements. For, situated on a long, narrow island, completely surrounded by water—and salt water at that—we have ideal conditions for an ideal installation. We may even banish hose carts, water towers and engines on wheels, and stop killing our citizens and the firemen (who are often strapped to their seats) in their mad career through our streets; sell our engine houses and take our firemen to fires in comfortable patrol wagons unaccompanied by the deadly juggernauts of dangerous fire apparatus.

This may be done by building underground parallel pipe lines at convenient distances apart from both the East and North rivers toward Broadway, with suitably situated and accessible valves to prevent undesired intercommunication.

These pipe lines could be connected to commodious stand-pipes in each building, and each floor provided with hose, and each fourth floor provided with pipes branching toward the exposed sides of each building from the stand-pipe, and provided with a dirigible nozzle toward the streets and areaways.

The river ends of each pipe would be provided with from three to five Siamese connections, to which the same number of fire-boats could be connected. It will then be possible to generate a water pressure that will blow the very skylights out of a fifty-story building; and if five fire-boats cannot do it, connect the stand-pipe with five other fire-boats from the other river.

A fire on any floor of a building thus protected may be fought from within by half a dozen streams of salt water, and from without with as many more from adjoining buildings, especially from across the street; and if any tiny steam fire engine wheezes its protests, it could by these means be washed into the bay.

If it be economical to build sky-scrapers, it will pay to protect them.

This system may find other very economical uses—such as flushing the sewers, sprinkling and sweeping the streets, melting snow and quelling riots.

The construction of a complete system of fire protection for Manhattan Island, substantially of the character described, would give us facilities far ahead of anything in the world. Then why wait for Oshkosh or Kalamazoo to set examples for us to follow like imitative monkeys, or adopt some little wrinkle from a jay town out West, when nature has given us advantages enabling us to be leaders and grandly systematic and progressive? As a city we should be admired and imitated for our progressiveness, instead of ridiculed for our conservative, servile imitations and antiquated, ineffective fire system.

The upper part of the island being much wider than the lower part, and the center being further from the river on each side, we might require an auxiliary system in case sixty-story buildings should be built in Harlem. When that time arrives, we will be duly prepared to master the situation by installing at convenient distances throughout the buildings, compact, efficient, direct-connected electric rotary pumps, taking their power from those unfailing sources of supply, the electric light and electric railway circuits, or both conjointly to insure positive results. This auxiliary system would help out our parallel pipe system, as outlined above, and compensate for the water friction in the additional length of pipe lines and the added heights of the stand-pipes, and in case of accidents of any nature these electric pumps could be connected with the present water system.

Our present water system is, from recent examples, too glaringly inadequate and out of date; and even though my suggestions are adopted finally by the city, it will take our municipal fathers and heads of departments so long to get their commissions agreeably adjusted that I would seriously advise the owners of our sky-scrapers to place no further reliance on the Fire Department or await the tardy action of the commissioners in the matter, but take immediate steps to install the electric pump system, as outlined, for emergency purposes, and thus be independent of municipal incapacity and procrastination. The chief points in its favor are its quickness, facility and cheapness of the installation and operation. It requires no skilled attendance other than the intelligence of turning a switch lever or a rheostat handle, and requires no addition to the present building employes. No steam boilers or additional machinery will be required. In fact, the system will be independent in all respects from existing apparatus, with practically no expense after installation, except interest on cost price and for electric current in case of fire, and possibly no appreciable extra piping, as the pumps could be connected directly to the existing water supply pipes.

This will be the most efficient makeshift possible until a dozen more million-dollar fires thoroughly accentuate the utter worthlessness of our fire system, and a long-suffering public get thoroughly aroused and demand radical improvements.

Low-Tension Accidents.

The safety rules of the Verband Deutscher Electrotechniker, which have already been accepted by most of the German Governments, have now also been accepted by the Prussian Government. The Minister, in his letter to Mr. Gisbert Kapp, the secretary of that society, asks to be informed what steps are intended to be taken with regard to voltages between 250 and 1,000, those up to 250 and over 1,000 alone having been dealt with in the above-mentioned regulations. The *Electrotechnische Zeitschrift* reproduces the communication made by the society to the Government on accidents caused in chemical and other factories. It is accentuated that the danger lies not in the pressure itself but in the strength of current produced by it. The current is in direct proportion to the pressure, and in inverse ratio to the resistance of the human body to the earth. From experiments made by Messrs. Siemens & Halske with their own workmen and those engaged in a sugar refinery, it appears that the average insulation resistance of the human body may be from 2,000 to 3,000 ohms under abnormal conditions, whereas it is as high as 100,000 ohms normally. This was ascertained in the following manner: Each workman was called from his work and made to grip one elec-

trode (representing the line), while the other electrode was placed on the ground. The range of the apparatus was from a few hundred ohms to 150,000. Other tests were made from hand to hand. The result was that out of 25 men in 17 cases the resistance was 150,000 ohms or more, in seven cases it varied from 50,000 to 150,000, and in the other test it varied from 4,000 to 17,000. All the workmen wore wooden shoes with leather toecaps. These results refer to normal trades. For workmen in certain factories the figures are very much lower. In one room in a sugar factory they ranged from 1,700 to 900 ohms. In the cooling-room, where the salt centrifugals are placed, it was from 2,400 to 1,000 ohms; in the boiling-room the resistance of the workmen was found to be from 3,000 to 1,200 ohms. Evidently much depended upon the dryness of the shoes. In the repairing shed, where the average resistance of the operators was 7,000 to 1,300 ohms, one man with new wooden slippers topped the list at over 150,000 ohms. In the sugar centrifugal room the limits were between 50,000 to 3,000 ohms—a wide range, indeed. Amongst nine men measured in the engine-room, six gave a resistance of over 50,000, two over 20,000, and one over 10,000 ohms. These figures are equally applicable to continuous as well as to alternating current.

LONDON NOTES.

[From our London Correspondent.]

Another Reason for American Competition.

At the present moment quite a number of electricity works in England are placed in a very awkward position by the failure of English electrical manufacturers to complete long-standing orders in anything like reasonable time. In some cases important municipal contracts are now over twelve months overdue, and if penalty clauses could be enforced there would be little profit remaining for the contractor. But that individual will shield himself by the strike clause when the very suggestion of penalty is even hinted at, and will blame everything on the protracted engineering strike of 1897–98. While we would not attempt to minimize the disastrous effects that that dispute had upon the electrical industry, we think it was by no means the only factor causing delay in completion of contracts. Some of the contracts are far longer overdue than the whole period over which the strike extended. It certainly looks very much as though English contractors are not in a position to turn out the machinery quickly enough to meet reasonable demands. Perhaps we may go so far as to accuse them of taking upon their books, for completion within so many months, orders which when booked there is not the least prospect of their being able to get ready within the stipulated period. The resultant inconvenience to the customer, whether municipality or company, needs no detailing, and the outcry against the importation of American and Continental machinery and apparatus is hardly warranted in the face of the present state of the matter. During the past few years borough electrical engineers, knowing there was little prospect of getting large plants made rapidly, have been looking a year or so ahead and placing their orders for extension plants long before they were likely to be required. But in several of these instances the increased demand for current and delay on the part of the maker of machinery have together led to disappointment, inconvenience and loss. At Manchester, for instance, the Corporation, acting under Mr. C. H. Wordingham's advice, ordered two large generating sets (for extensions), each of 2,500 HP. and capable of supplying together 100,000 8-CP. lamps. One of these was guaranteed to be running by *October, 1897*, and the other by September of this year. But neither of these is yet at work and the station is working with the same plant capacity as it had in March, 1897. On account of the increasing consumption, the matter became serious, and in November, 1897, the Corporation stopped making further connections for four months. At the end of that time, relying upon the faithful promises of contractors, other premises were connected to the mains with the result that to-day the whole of the plant is overloaded, and consumers are having to put up with a light at as low as 87 volts pressure for several hours daily. There is an order for ten boilers also considerably overdue, and in consequence the present steam plant is being forced. The Corporation has been placing the facts before consumers and asking for forbearance for a short time, and requesting them to dispense with as many lamps as possible from 4 P.M. to 6 P.M. At Edinburgh the situation is also deplorable, and the low pressure is giving rise to complaints on every hand. Generators and boilers are much overdue, hitches have occurred in the supply, and the management has been driven to temporary expedients. During the last few days the Corporation has had to do the same as the Manchester authority and ask for the co-operation of consumers by dispensing with certain lamps between 5 and 7 P.M. daily.

We think that there is an excellent opportunity for American houses, who are in a position to give quick delivery, to secure contracts, for if these delays are likely to continue English companies and municipalities will be more inclined to sink their likes and dislikes under the head of patriotism, and will buy in the most convenient market. The current friendly feeling for America and Americans would at any rate weigh with the more or less emotional municipal man.

Electric Cabs a Financial Failure.

Although from the point of view of convenience, etc., for street traffic the electrical cabs running in London give every satisfaction, their working is attended by anything but financial success. The London Electrical Cab Company during the twenty months ending July, 1898, shows a loss of over £6,000. When the service started, current was taken under agreement from one of the London electricity supply companies, but the cost was so excessive that now the cab company has put down a special generating plant and charges its accumulators itself, with a consequent reduction in cost. The maintenance of the accumulators and also the renewal of rubber tires are matters which have caused considerable anxiety and expense. We understand that experiments are being made with the Hatch accumulator in connection with the cab service.

Meeting of Educational Societies.

During Christmas week the American Chemical Society, the American Society of Naturalists, the Geological Society, the Society of Biblical Literature and the Mathematical Society will hold meetings under the auspices of the respective departments of Columbia University.

On Wednesday, the 28th, President Morris K. Jesup of the American Museum of Natural History will welcome the American Society of Naturalists at the American Museum in Eighty-first Street. Prof. Henry Fairfield Osborn will deliver a lecture, which will be followed by a reception at the home of Prof. Osborn.

The American Mathematical Society will hold its annual meeting on December 28 in Fayerweather Hall. The President, Prof. Simon Newcomb, of Washington, will preside. During the session the following papers will be read:

"Multiple Resonance," by Prof. M. I. Pupin, Columbia University; "On Transformation of Straight Lines Into Spheres," Prof. E. O. Lovett, Princeton University; "On a Certain Partial Differential Equation and Its Connection with Dirichlet's Principle," Dr. Waldemar Schulz, Cornell University; "On Development of the Perturbative Function in Terms of the Eccentric Anomalies," Dr. A. S. Chessin, formerly of Johns Hopkins University; "On Some Points of the Theory of Functions, Dr. Chessin; "On the Memoir or the Substitution Groups Whose Degree Is Less Than Nine," Dr. G A. Willard, Cornell University; "On Solution of Delaunay's Canonical Equations," Prof. Ormond Stone, University of Virginia; "A Generalization of Appel's Factorial Functions," Dr. E. J. Wilczynski, University of California.

New York Electrical Society.

The 192d meeting of the New York Electrical Society was held on Wednesday evening, December 14, at the College of the City of New York. The meeting was called to order about 8:10 with President Gano S. Dunn in the chair. Colonel Eugene Griffin of the First New York Volunteer Engineers spoke at some length on the problems and difficulties which led to the organization of the volunteer engineer corps in the late war, and concluded his remarks by recommending that an organization to be known as the United States torpedo militia be formed, to be composed of skilled electricians and engineers, which could be called upon by the Government in time of war.

The next speaker was Mr. F. W. Roller, who held the position of Chief Engineer on the Nashville during the conflict with Spain, which had afforded him an excellent opportunity of judging of the merits of electrically operated machinery on the vessels of the navy. Mr. Roller divided the electrical apparatus on a man-of-war into two classes, the first including enunciators, range-finders and various indicating and firing appliances; the second comprising incandescent lamps, motors and searchlights. Practically all the appliances of the first group, Mr. Roller said, were failures. On the other hand, the apparatus of the second class invariably proved satisfactory.

A paper by Mr. W. D. Weaver, entitled "Electricity in the War" (which will be found elsewhere in this issue), was then read by Mr. Roller in the absence of the author.

Captain Zalinski, well known as the inventor of the dynamite gun, made the closing address. He referred to the work of the Vesuvius, regretting that no opportunity had arisen during the war for testing the dynamite gun in a naval conflict.

The meeting was quite well attended, there being about 100 persons present.

Exports of Electrical Material from New York.

The following are the exports of electrical material from the port of New York for the week ending December 19:

Argentine Republic—289 packages, $17,650.
Brazil—1 case, $24.
Bremen—8 packages, $1,791.
British East Indies—5 cases, $183.
British West Indies—63 packages, $3,135.
British Possessions in Africa—16 cases, $275.
Cuba—29 packages, $641.
Ecuador—1 package, $12.
Hayti—2 cases, $207.
Hamburg—63 packages, $3,089.
London—31 packages, $4,504.
Odessa—4 cases, $110.
Porto Rico—26 cases, $1,213.
St. Petersburg—4 cases, $983.
Venezuela—1 case, $38.

Personal.

Mr. James R. Wiley, the Western manager of the Standard Underground Cable Company, is in New York on a Christmas visit to his Eastern friends. Mr. George R. Wiley, the Eastern manager of the same company, whose office is 18 Cortlandt street, reports business in first-class condition, and looks forward to a big increase in the coming year.

LEGAL NOTES.

The Thomson-Houston Electric Company and the General Electric Company have entered suits in the United States Court at Cincinnati against the Steel Motor Company and Johnson Electric Company, who are charged with making a style of electric commutator or switch on which the plaintiffs claim to have a patent.

The Court of Appeals of the District of Columbia held, in the recent case of the Metropolitan Railroad Company vs. Hammett, reported in the Washington *Law Reporter*, that an electric car has no exclusive or superior right of way at a point where its track intersects that of a horse-car line, but must be stopped to allow the horse car to pass when the latter arrives first at the point of intersection; that in such case the driver of the horse car is justified in supposing that the electric car is moving within the maximum rate of speed prescribed by law, and that his rights as that of the first arrival at the crossing will be respected by those in charge of the electric car, and that where under such circumstances a collision occurred between the horse car and the electric car by reason of the high rate of speed at which the latter was moving, and its failure to stop before reaching the point of intersection, it could not be said as a matter of law that the driver of the horse car was guilty of contributory negligence in attempting to cross the track of the electric car.

CANADIAN NOTES.

Dr. C. J. Edgar, manager of the Eastern Townships Light & Power Company, has concluded the purchase of the water power at Nengle's Dam, near Rock Forest, Quebec. The company intends to transmit electrical energy for power and lighting purposes to the city of Sherbrooke, Que.

The Lieut.-Governor-in-Council of the Province of Ontario, on the advice of the Attorney-General, has referred to the High Court of Justice for the Province certain questions to determine whether the non-completion by the Niagara Power Company of the water connections to the extent of 20,000 horse power, and 10,000 horse power actually ready for use, supply and transmission by the 1st of November, 1893, has not put an end to the agreement between the Park Commissioners and the company giving the latter exclusive use of the water power at Niagara Falls.

A syndicate of Toronto, Ont., capitalists is said to be now in Havana, Cuba, endeavoring to secure the franchise of the street railway system in that city. The gentlemen named are William MacKenzie, Frederick Nicholls, S. F. Madden and Z. Lash. The franchise includes an electric railway system for Havana and a steam railway to Matanzas. The latter railway is in existence, but for the city there is nothing at present save a line of cars drawn by mules. Sir William Van Horne, president of the Canadian Pacific Railroad, is also said to be interested.

The three county judges who have been hearing the appeal of the Bell Telephone Company from the assessment as fixed by the city of Toronto, Ont., have given judgment, knocking off over a half a million dollars. The assessment on land and buildings was not touched, but that of $377,992 on poles, wires and conduits was reduced to $32,750; the one of $177,174 on one switchboard was cut to $12,000 and on two others $50,733 to $3,900. This reduction is made because the company claims, and the judges decide, that the material should be assessed not as of a system in operation, but as separate parts, for what they would bring if they were taken away and sold.

Owing to the detrimental effect of the electric circuit in the city of Toronto, the Dominion Government found it necessary to move its Observatory to Agincourt, nine miles from Toronto. At present there is no electric railway at that point within seven miles, and little prospect of any being built for years to come. The new Observatory, which was finished last September, is divided into two parts. The circular cellar, nineteen feet in diameter and above ground, is an erection where the magnetic determinations will be made. Great care was taken in selecting materials for the building. Every stone used was tested for magnetic effect, and nothing but copper or zinc nails and fastenings have been used.

THE NEWS.

What is Going On in the Electrical World.

LIGHTING.

Annapolis, Md.—The city council is considering a proposition to have the city purchase an electric light plant.

Bad Axe, Mich.—The local lighting company has offered to sell its plant to the village for $12,000, but the council considers the price too high.

Rogersville, Tenn.—A franchise has been granted to Webster & Spears to locate an electric plant at Spears' Mill, two miles from Rogersville. They will supply electricity for lighting this town.

Camden, N. J.—The lighting committee of the city council at a meeting on the 15th inst. decided to readvertise for proposals to light the city by electricity for periods of one, three or five years, the bids to be opened December 29.

Des Moines, Ia.—The General Electric Company has transferred to the Edison Company its electric light plant in this city, and the dam connected with it, for $116,000.

Eldora, Col.—A twenty-year franchise has been granted to the Eldora Mining, Milling & Power Company to put in water and electric lights for this town. Work will be commenced in the spring.

Ellicott City, Md.—The question of lighting the village of Savage by electric lights at county expense has been settled by the county commissioners deciding to authorize the improvement.

Enfield, Conn.—A petition is to be presented to the State Legislature for a charter to be granted for the formation of a light and power company in Enfield, to be known as the People's Light & Power Company, the object being to produce, generate, manufacture, buy, sell and distribute gas and electricity in the town of Enfield. The petition is signed by Thompson S. Grant, Edward Prickett and several other influential citizens of Enfield.

Grand, Rapids, Mich.—The lamp test authorized by the board of works was made on the 9th inst., but the board has disregarded the report of the committee and definitely settled the question by adopting the Adams-Bagnall lamp, although it was not entered in the tests, the company holding that in the contract with the Chase Construction Company for the installation of the new municipal plant the Adams-Bagnall lamp was one of the two distinctly specified. The decision of the board was probably a prudential one, to avoid a lawsuit.

Huntingdon, Tenn.—This town will soon vote on the question of putting in an electric light plant.

Jeffersonville, Ky.—Frank Patterson, who represents a Chicago firm, is trying to secure a lighting contract from the council. He is reported as offering to furnish 100 arc lights at the rate of $60 a year each, and any additional number at $58 each. The city under the present contract is paying $90 each for forty-five arc lights and $85 for all lights in excess of that number. There are doubts about the validity of this contract, and the council has asked the city attorney for an opinion on the question.

Johnstown, N. Y.—The special committee to consider and report matters of city improvement which should be submitted to the taxpayers at a special election has reported a list of propositions, among which is the equipment of the municipal electric lighting plant. The report was accepted by the council.

Medina, N. Y.—The board of aldermen, acting with the citizens' committee, have made a contract with A. L. Swett for lighting the village for five years. The agreement provides that all public buildings, such as the school houses, police station, etc., should be lighted gratis, and the street lights should be lighted on the moonlight schedule until 1 o'clock for $60 per light, but gives the village the option of at any time changing this system to an every night schedule for $70 a lamp, or all night lights on the 1 o'clock schedule at $80, or the all night every night system at $90.

Milwaukee, Wis.—The committee on public buildings of the county board is considering the advisability of installing a heat, light and power plant in the courthouse. It is thought that a plant can be put in at a cost of about $10,000. Nothing will be done about the matter until after January 1.

Milledgeville, Ga.—The council has given up the idea of purchasing an electric light plant for the city for the present, and has made a new contract with the Milledgeville company for $500 less than the last contract.

Moro, Ore.—H. V. Yates, proprietor of the water plant at Heppner, is investigating the feasibility of establishing an electric light and power plant on the Deschutes river to supply Moro and perhaps Grass Valley and Wasco with light and power.

Palouse, Wash.—Charles McKenzie and J. W. Higgins of Colfax have been negotiating with the city council and business men of Palouse for the establishment of an electric light system in the city and think it likely that a plant will be put in. Mr. McKenzie is one of the owners of the electric light plant in Colfax.

Pelican Rapids, Minn.—This village at a special election on the 7th inst. voted bonds to the extent of $14,000 for the purpose of constructing a system of waterworks, an electric light plant, etc.

Santiago, Cuba.—Gen. Wood has arranged with the American Electric Lighting Company to illuminate the streets of Santiago with incandescent lights at every corner and arc lights in the main plaza.

St. Thomas, Can.—This city will vote in January on a by-law to raise $33,000 for the establishment of an electric lighting plant under municipal control, the plant to be of sufficient capacity for 100 arc lights.

Tampa, Fla.—The big dam of the Consumers' Electric Light & Street Railway Company, nine miles from this city on the Hillsborough river, was blown up on the night of the 13th inst. It seems that countrymen opposed to the company exploded dynamite, completely destroying a plant which cost more than $100,000. Electricity for lighting and street railway power for Tampa is derived by the company from the river, the power house being near the destroyed dam.

Wellington, Kan.—At a meeting of the Commercial Club held recently it was decided to submit a proposition to vote $100,000 of bonds to bear 4 per cent. interest for the purpose of enabling Wellington to purchase or construct a waterworks system and electric plant. The committee appointed to take charge of the matter consists of John T. Stewart, A. Graff and W. A. Renn.

Wilkes-Barre, Pa.—The project for a new electric light plant in this city is said to be meeting with much favor. The projectors expect to raise $50,000 for the purpose, and have already obtained several subscribers for the stock.

Zanesville, O.—The commission appointed some months ago to investigate the feasibility of erecting a municipal electric light plant have made a report to the council recommending that the city continue under the contract system. The commissioners, after investigation, were of the opinion that the saving of a municipal plant, if there should be any, would be too small to warrant the expense and trouble of maintaining the same.

STREET RAILWAYS.

Ansonia, Conn.—A corporation has been formed in this city to be known as the Seymour Electric Railway Company, which will petition the next session of the General Assembly for the privilege of building and operating a trolley road between this city and Seymour. The incorporators are prominent business men of Seymour and Ansonia.

Boston, Mass.—The Boston, Quincy & Fall River Bicycle Railway Company, E. Moody Boynton president, has filed an application to the Legislature to have the time limit for building its railway extended. Under the act of 1897 at least twenty miles must be constructed by June 11, 1899. Mr. Boynton believes that the road will be built in time, but wants to be on the safe side.

Elmira, N. Y.—Surveyors are now at work on the Elmira-Watkins electric railroad, and it is confidently expected that the road will be constructed and ready for operation by the 1st of May. It will be necessary to construct seventeen and one-fourth miles of track to complete the road.

Hartford, Conn.—F. W. Siebert, Edward W. Shedd and C. Siebert will apply to the incoming Legislature for a charter to build an electric street railroad in Cromwell.—An application will be made to the General Assembly by the Hartford & Springfield Railway Company and others for the incorporation of a company whose purpose it shall be to construct and operate a street railway in the towns of Hartford, Wethersfield, Rocky Hill, Cromwell and Middletown for the purpose of carrying passengers and freight.

Libertyville, Ill.—The village board has granted a fifty-year franchise to the Chicago & Fox Lake Electric Railway to construct a trolley line through this place. The company contemplates the construction of a cross-country electric line from Lake Michigan to Fox Lake next spring.

Middletown, Conn.—Thomas M. Waller, S. Harrison Wagner, James K. Guy, I. A. Kelsey, E. W. Goss, James W. Dewell and W. B. Furgeson have filed notice that an application will be made by them to the General Assembly of the State at the approaching session for the incorporation of a street railway to run from Middletown to Meriden.

New London, Conn.—Samuel Eddy and J. H. Roraback of Canaan will apply to the next General Assembly for right to incorporate a street railway company to operate from Twin Lakes to Canaan and thence northerly to the Massachusetts line, where connection will be made with a line running to one or more of the popular resorts about Great Barrington.

Owosso, Mich.—The Long Lake, Durand & Corunna Electric Street Railway Company will begin work in Durand before the last of December and will work toward Owosso. The road will be completed this winter as far as Corunna, where it will join with the Owosso & Corunna Traction Company's road. Early in the spring work will be pushed to Long Lake, and possibly as far as Pontiac.

Pine Bluff, Ark.—After many promises and as many disappointments, an electric car line and lighting plant are assured for this city, the necessary amount of stock having been fully subscribed through the efforts of Col. S. W. Fordyce, late president of the St. Louis Southwestern Railroad, Mayor D. C. Bell and Attorney

Henry C. Wood of Chicago. Work on the plant will begin at once.

Pittsburg, Pa.—The bursting of a 15-foot flywheel at the Birmingham Traction Company's power plant, South Thirtieth and Carson streets, on the night of the 11th inst, wrecked a 300 horse-power engine, damaging the building to a considerable extent. The accident created a great deal of excitement in the neighborhood, the noise being heard for several squares away. A crowd was on the spot in a few minutes. When an investigation was made it was discovered nobody had been hurt. Engineer Sy Kerr had walked around the engine but two minutes before, and had gone out into the main power building, where he was when the wheel burst.

Reedsburg, Wis.—A thirty-year franchise has been granted to a Sauk County corporation for an electric railway from Devil's Lake to Baraboo, Minor Lake, Delton and Kilbourn, making a direct connection between the Northwestern and Milwaukee railroads.

Saginaw, Mich.—An electric railway from Saginaw to Detroit is said to be contemplated by a number of Detroit and Eastern capitalists. Work will begin in the spring.—The Saginaw & Frankenmuth Railway Company is securing right of way and construction will soon begin.

Trenton, N. J.—Ex-Senator George O. Vanderbilt and Mr. Sadlier, representing a number of capitalists, are said to be acquiring right-of-way over private lands for a trolley line between Trenton and Princeton via Lawrenceville. The line will be chartered under the general railroad law, enabling it to carry freight and express as well as passengers.

Troy, N.Y.—In connection with the rumor that Troy and Hoosick Falls are to be connected by an electric line it is stated that North Adams and Albany capitalists are the promoters of the scheme, and that the enterprise is not connected with the Hoosick Valley Electric Railway. It is stated that parties interested in the electric railway between North Adams and Williamstown are also interested in the proposed new road, and that the plan is to meet with that road at Williamstown, thus giving a direct line from North Adams to Troy. The proposed route will be through a country greatly in need of a railroad of some kind.

Washington, D. C.—The District Commissioners have approved the request of the Columbia Railway Company for permission to change the motive power of the road from cable to electricity. The Columbia Railway is the only remaining street car line in Washington depending upon the cable as a motive power.

Winsted, Conn.—A number of capitalists headed by W. H. Terry and H. L. Sanbom of Canton will make application to the General Assembly for a charter to build a trolley road through the towns of Avon, Canton, New Hartford, Barkhamstead, Winchester and Colebrook to the Massachusetts line. The proposed road will nearly parallel the Philadelphia, Reading & New England Railroad between Winsted and Hartford, a distance of 30 miles.

POWER AND TRANSMISSION PLANTS.

Black Hawk, Col.—It is the intention of the Bringham Mining & Milling Company to erect a 50-ton plant for low grade ores near this town. The method of treatment will be first by roasting, second by chlorination, third by leaching, and fourth, precipitation by electrolysis, the values forming a chloride to be afterwards separated by electrical appliances. The cost of the plant will be about $20,000 and the Gates Company of Chicago is reported to have received the contract.

Lake City, Col.—The Hinsdale Electric Light & Power Company of this city has purchased a tract of land near Argenta Falls from A. E. Reynolds, and will utilize the water to supply light and power to the city and mines in this vicinity.

Richmond, Va.—The company which is to develop the water power of the James River, the Virginia Electrical Railway & Development Company, has applied to the street committee for permission to acquire the privileges granted by ordinance to the Virginia Electric Company of Baltimore and to utilize the $5,000 in bonds put up by the Southern Electric Company, the franchise of which is to be allowed to die; both of these companies have by assignment of rights or otherwise been merged in the Virginia Electrical Railway & Development Company. Under the new organization, the company agrees within fifteen months from the approval of the ordinance, to begin in a manner satisfactory to the city engineer, to construct and erect such hydraulic work in and near James river as may be necessary to furnish water power to produce not less than two thousand horse power of electricity for the furnishing of electric power and light. The officers of the Virginia Railway & Development Company are: President, F. C. Todd; directors: F. C. Todd, L. M. Williams, R. L. Williams, F. L. Todd, F. P. Christian, of Lynchburg, Va., John L. Williams and W. I. Cross of Richmond.

San Diego, Cal.—One of the most famous of the big irrigation dams of the world is that at Sweetwater, which has stood for ten years. It is proposed to get some 2,000 horse power at this dam and transmit it to this city, twenty miles. U. S. Grant, Jr., and Jesse Grant, sons of General Grant, are at the head of a company which has the plan in view. Electrical engineers have reported that nowhere can water power be developed and transmitted cheaper than in San Diego County. There are other great water powers in San Diego mountains and canons, and it is reported that the Atchison, Topeka & Santa Fe Railroad Company is having its engineers search there for a new power for its locomotives on the Southern California division.—A project to harness the waters of the stream in Sanchez Canon, among the Sierras, back of Stockton, in the upper part of the San Joaquin Valley, is going ahead. Engineers are at work ascertaining what power may be developed there and the best means of conveying it from the mountain streams and waterfalls to Stockton and possibly to San Francisco. Enough work has been done to show that at least 4,000 horse power may be sent in an electric current from the transformers over several copper wires through the San Joaquin Valley.

MANUFACTURING, ETC.

Columbus, O.—The Bullock Electric Manufacturing Company of Cincinnati has filed notice of change of location to Norwood, a suburb of Cincinnati.

Durban, Natal.—The town council is about to appoint a commission of two engineers to investigate and report upon the electric street railway systems of America and Europe, in order that they may intelligently decide upon the best system to be installed in Durban.

New York.—The contract for the equipment of the new underground trolley system of the Third Avenue Railroad Company has been awarded to the Westinghouse Electric & Manufacturing Company. The contract involves the expenditure of about $5,000,000. By the terms of the contract the Westinghouse Company will construct the steam engines, boilers and entire steam plant necessary to equip the power house, besides the car equipment, electric generators and all the electrical apparatus required. The plans call for a power house on the company's property at 216th street with a steam and electrical capacity of 64,000 horse power.

Washington, D. C.—Proposals will be received at the Bureau of Navigation, Navy Department, until 12 o'clock noon on Thursday, the 12th day of January next, for the construction of a power house at the Naval Academy, Annapolis, Md. All requisite information may be obtained on application to the Chief of the Bureau of Navigation, Navy Department; the Superintendent of the Naval Academy, Annapolis, Md., or Mr. Ernest Flagg, architect, 35 Wall street, New York.

West Superior, Wis.—The contract for the electrical plant for the Great Northern's 3,000,000 bushel steel tank elevator has been let and construction of the elevator will begin as soon as possible in the spring.

COMPANY MATTERS.

Elbridge, N. Y.—The Elbridge Electrical Apparatus Company has bought the stock, fixtures and good will of the Elbridge Electrical Manufacturing Company, and the business will be conducted hereafter under the name of the Elbridge Electrical Manufacturing Company.

PERSONAL AND MISCELLANEA.

Dwight H. Gay, an electrician, employed at a theater in Portland, Me., became demented recently and was placed under restraint. On the night of the 8th inst, he managed to elude the vigilance of the attendants in the hospital where he was confined and committed suicide by hanging. Mr. Gay was 37 years of age and a native of Orange, N. J.

Capt. P. Pizzini of Richmond, Va., who for several years has been acting as Assistant General Manager of the Richmond Railway & Electric Company, was in New York last week. It is understood that the object of his visit was to tender his resignation to the controlling stockholders of the road.

The Chester, Pa., "Times" states that Samuel Haigh, superintendent of the Citizens' Electric Light & Power Company of Clifton Heights, proved himself a mechanic equal to an emergency when a recent storm blew down the two smoke stacks at the power-house, thus shutting off the draught, and coming within an ace of leaving the adjacent territory in darkness, and also of shutting off the power from the trolley cars on the Delaware County & Philadelphia line. Mr. Haigh at once improvised a forced draught, and so kept the currents going all night. Around Clifton he is now "the lion of the hour," and his prompt and effective action having come to the ears of the company, he is also receiving commendation from that source.

At Cincinnati a few days ago, as we learn from the "Enquirer," an attempt was made to remove a portion of a burglar proof steel vault in the Lafayette Bank by burning it out with electricity. The experiment was partially successful, for when the electric arc was applied to the plates the steel melted before it like butter, but the men who undertook the job will hesitate before undertaking a similar one. They were Manager Luke Lilley and George Minch, of the Devere Electric Company. After assuring themselves that electricity would do the work, they left the bank building with the intention of going to the Devere Company's office, but before they had taken a dozen steps they were both seized with pains in their eyes which were so excruciating that they could hardly desist from making some sort of an outcry. They were quietly hurried to their homes where they are now kept in dark rooms. As near as can be ascertained the trouble is due to the fact that the optic nerve was affected by the brilliant glare when the carbon came in contact with the steel sheet of the vault. Every time the tool touched the steel a light was shown even brighter than the reflections from an arc lamp. This brilliant glare, it is thought, partially deadened the optic nerve and in this way the sufferings of the two men were brought about. Both wore heavy blue glasses, but these seemed to have lost their effectiveness so far as the burning of the steel was concerned. It will take several days to determine how seriously the two men's eyes have been injured, and, of course, the work of burning away the vault has been abandoned until they recover. It is likely that some optician will be able to manufacture a glass that will defy the piercing and brilliant rays, and in this event the work will be carried on.

RECENT COMPANY ELECTIONS.

Allentown & Kutztown Traction Company, Allentown, Pa.—President, H. J. Schmick of Hamburg; secretary, G. H. Gerber of Pottsville; treasurer, C. A. Dorney of Allentown; directors: the officers and Howard E. Ahrens of Reading, Asa R. Beers of Mauch Chunk, and W. D. Mohn of Mohnsville.

Bennington & Hoosick Valley Electric Railway Company, Bennington, Vt.—Directors: George E. Greene, Galen C. Moss, Edward L. Bates, Irving E. Gibson, Joseph Buckley, Watson M. Holmes, Levi E. Worden, William C. Geer and F. S. Donnell.

Catoctin & Myersville Electric Railway Company, Myersville, Md.—Directors: Cyrus F. Flook, D. C. Winebrener, George William Smith, Joseph W. Gaver, William M. Bittle, John C. Leatherman, George Dallas Gaver, Charles Johnson, George T. Thomas and John T. Hildebrand.

Consolidated Street Railway Company, Worcester, Mass.—President, Francis H. Dewey; vice-president, A. G. Bullock; treasurer, A. H. Stone; directors: the officers and Thomas C. Barr of Newark, N. J., and E. F. Moore of Philadelphia.

Lancaster Gas Light & Fuel Company and Edison Electric Illuminating Company, Lancaster, Pa.—President, John I. Hartman; secretary, J. H. Baumgardner; treasurer, John C. Carter; directors: the officers and J. D. Skiles, J. Fred Sener, H. M. North, N. Milton Woods, W. U. Hensel, D. McMullen, J. Gust Zook, H. C. Demuth, Dr. George R. Rohrer, H. S. Williamson and P. B. Shaw.

Washington Illuminating Company, Washington, Ia.—President, W. A. Cook; vice-president, J. Klein; secretary and treasurer, Frank Stewart; directors: W. A. Cook, J. Klein, William Smouse and C. W. Stephens.

COMMERCIAL PARAGRAPHS.

The Electric Storage Battery Company, Drexel Building, Philadelphia, makers of the well-known Chloride Accumulator, have recently gotten out an interesting pamphlet in which among other things they say: "Few things have hindered the development of the storage battery so much as patent litigation, which has operated not only to arrest improvements in accumulator construction but to limit the sphere of usefulness of accumulator cells by impressing intending purchasers with their liability to law-suit. The policy of the Electric Storage Battery Company has been from the very first to protect the users of storage batteries in their rights. To carry out this policy the Electric Storage Battery Company some years ago acquired all the basic patents and patent rights underlying the manufacture of storage batteries, whereby it secured to itself the sole right to supply in the United States all the important types of storage batteries developed to that time. Since then it has secured control of the patents and patent rights for new and valuable types. As in the past, so in the future, absolute protection will be guaranteed to the users of every form of storage cell manufactured by this company. The acquisition by the Electric Storage Battery Company of the patents and patent rights for the manufacture of all the modern types of storage batteries enables it to furnish cells that are adapted for special work."

The American Pegamoid Company, 346 Broadway, New York, is handling a high grade of paint for various uses which from all accounts appears to be giving great satisfaction. The following communication received by the company speaks for itself:

The National Automatic Machine Co.,
60 and 62 Murray St.,
New York, June 25, 1898.

The American Pegamoid Co., New York Life Building, 346 Broadway, City.

Gentlemen: It affords me much pleasure to report that the use of your "Pegamoid Aluminum Paint" has been most satisfactory. We have tried all sorts of compositions, bronzes, paints, varnishes, etc., but owing to the exposed positions of our machines we have experienced great difficulty in keeping them in good appearance. We have painted a large number of our machines with your Aluminum Preparation, and after several months' trial we are convinced that it will answer all requirements. Yours very truly, L. W. BALDWIN, Treas.

The Electric Appliance Company, Chicago, have taken the general Western agency of the well-known Crescent Tin Shade. This shade has been designed with a view to displacing the ordinary flat tin shade, and it is being manufactured in such large quantities that it can be sold for even a less price than the flat shade. It is curved in shape to concentrate the light as much as possible and has its bright surface corrugated to give a good distribution. It should certainly find a large field where the demand is for a durable and inexpensive shade or reflector.

INCORPORATIONS.

The Pine Bluff Electric Light & Street Railway Company, Pine Bluff, Ark. Capital stock, $300,000. Incorporators: Thomas L. Chadbourne, Jr., and Henry C. Wood of Chicago; H. H. Hunn, Sebastian Geisreiter, Peter P. Byrd, Jeff Hicks and Sam Taylor of Pine Bluff.

The Swedesboro Light, Heat & Power Company, Swedesboro, Pa. Capital stock, $25,000. Incorporators: Charles D. Lippincott, Henry M. Mitchell, Thomas B. Turner, John C. Rulon, Benjamin F. Lawrence and James J. Davidson, all of Swedesboro.

The W. E. Donley Electric Light & Power Company, Big Rapids, Mich.—to supply electricity for light, heat and power. Authorized capital, $10,000, all of which has been subscribed. Incorporators: W. E. Donley, J. S. Donley, D. M. Martindale, Chicago, Ill.; J. W. Morton, W. I. Trott, Big Rapids.

The Bloomfield & Orchard Lake Railway Company, Birmingham, Mich.—to construct and operate a street railway. Authorized capital, $25,000, all subscribed; paid in, $5,250. Incorporators: George E. Daines, Frank Hagerman, Almeron Whitehead, M. F. Lillis, Pontiac; George T. Hendrie, Detroit.

The Tuolumne County Water & Electric Power Co., Columbia, Cal.—to furnish water and electric power and light. Authorized capital, $550,000; subscribed, $143,000. Incorporators: J. W. Ellis, William Mansfield, Thomas Conlin, J. B. Pownall, Columbia; M. B. Harrimann, Shaws Flat; George Wight, Springfield, and George W. Hale, Sonora.

The Bradford Electric Light Company, Bradford, Ill. Capital stock, $10,000. Incorporators: Robert Thompson, Daniel J. Phoenix, Edmund P. Deyo and John P. Code.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED DECEMBER 13, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

615,936. Trolley-Replacer for Electric Railways. Lucian A. Cowles, Randolph, Mass. Filed Feb. 7, 1898.
616,031. Trolley-Wheel Replacer. George E. Mittinger, Jr., Cleveland, O., assignor of three-fourths to Frederick J. Schweitzer, same place. Filed Sept. 2, 1898.
615,977. Car-Fender. Millard F. Field, Boston, Mass. Filed March 4, 1898.

ELECTRIC LIGHTS AND APPLIANCES.

615,686. Electric Lamp. Walter S. Doe, Jersey City, N. J., assignor of one-half to John H. Weastell, same place. Filed Aug. 12, 1897. Renewed April 29, 1898.
615,904. Electric-Lighting Apparatus for Railway-Cars. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed July 7, 1898.
615,905. Electric-Lighting Apparatus for Railway-Cars. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed July 9, 1898.
615,927. Electric-Arc Headlight. William G. Wagenhals, Dayton, O., assignor to the United States Headlight Company, Utica, N. Y. Filed Nov. 18, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

615,673. Method of and Apparatus for Electrically Transmitting Power. Charles S. Bradley, Avon, N. Y. Filed July 14, 1897.
615,731. Dynamo-Electric Machine. William M. Mordey, Loughborough, England. Filed Feb. 15, 1897.
615,732. Dynamo-Electric Machine. William M. Mordey, Loughborough, England. Original application filed Feb. 15, 1897. Divided and this application filed Dec. 30, 1897.
615,952. Alternating-Current Generator. Charles S. Bradley, Avon, N. Y. Filed July 14, 1897.
615,953. Controlling Alternating-Current Motors. Charles S. Bradley, Avon, N. Y. Filed July 14, 1897.
615,954. Changing Period and Phase of Alternating Currents. Charles S. Bradley, Avon, N. Y., assignor to the General Electric Company, of New York. Filed June 22, 1896. Renewed Nov. 17, 1898.
616,035. Electric Motor. Julius L. Thoma, Kansas City, Mo., assignor of seventeen-twentieths to Agnus M. L. Miller, Crescent P. Brod, Louise V. Panhoff and John Potzner, same place. Filed June 20, 1898.
616,063. Ball-Bearing for Electric Motors. John Murphy, Torrington, Conn., assignor of two-thirds to David F. Halstead, New York City, and William M. Keepers, Newark, N. J. Filed March 15, 1898.

TELEPHONE AND TELEGRAPH APPARATUS.

616,016. Telephone-Switchboard. Thomas F. Ahern, Detroit, Mich., assignor to the Detroit Switchboard & Telephone Construction Company, same place. Filed May 27, 1897.

MISCELLANEOUS.

615,691. Method of Manufacturing Electrical Cables. Sebastian Z de Ferranti, Hollinwood, England. Filed Dec. 28, 1897.
615,693. Hysteresis-Meter. James L. W. Gill, Montreal, Canada. Filed March 25, 1898.
615,699. Electroplating Apparatus. John E. Hartley and Herbert E. Hartley, Birmingham, England. Filed Dec. 28, 1897.
615,752. Railway-Crossing Signal. John D. Taylor, Chillicothe, O. Filed Jan. 12, 1898.
615,814. Electric Firing Device for Ordnance. Arthur T. Dawson and George T. Buckham, London, England, assignors to the Vickers, Sons & Maxim, Limited, Sheffield, England. Filed May 16, 1898.
615,835. Vacuum Insulator for Electric Conductors. Joseph A. Poche, New Orleans, La. Filed Oct. 6, 1898.
616,019. Electrical Bedbug Exterminator. Frank M. Archer, New York City, assignor to Siegfried Silberberg, same place. Filed Feb. 7, 1898.

TELEPHONE AND TELEGRAPH.

A New Telephone Company in Boston.

The Massachusetts Telephone & Telegraph Company has been granted a franchise to lay conduits for its wires in all the streets of Boston. In reference to the new company, the Boston *News Bureau* says:

"The people at the head of the new company are mostly connected, or have been in the past, with the Lamson Store Service Co., prominent among whom are Messrs. Oakes Ames, A. C. Titcomb, John Shepard and General Counsel E. C. Gilman. Z. T. Holbrook, promoter and president of the company, was formerly Chicago manager of the Lamson Co. Minor officials of the Lamson Co. have been interested in independent telephone companies in the West for some time past.

"No money has been paid in as yet. Its capital of $10,000 is only nominal. It is proposed to capitalize it at between $2,000,000 and $3,000,000. The company proposes to use the 'automatic' system now in use in a small way in the States of New York, New Jersey and Pennsylvania. The chief financial advantage claimed for this system is its economy, it being entirely automatic in its exchange system, doing away with 'central' operators. The company anticipates no difficulty in securing subscribers. A canvass for subscribers will soon be made. Contracts will not become binding upon the subscriber until contracts for 10,000 telephones have been secured at a price not above $6 per month. The new company will be obliged to build conduits through the streets for its wires, as no existing conduits are available. It is claimed that the English and German rights for the use of the 'automatic' telephone have been sold for $1,000,000."

In three months the franchise of the Duluth Telephone Company expires, and the city authorities of Duluth have already asked for bids from those anxious to supply telephone service for the city. The bids are to be opened January 20, and are to specify what percentage of gross earnings the bidders will be willing to give the municipality in return for allowing them an exclusive franchise for a term of years. The Duluth Telephone Company has just completed the necessary equipment for operating a metallic circuit for telephones capable of transmitting over a long distance line direct and is putting them in residences at $36 per annum each for two 'phones on one line.

The Cumberland Valley Telephone Company, which operates at Chambersburg, Pa., and in that vicinity, has issued a circular warning its subscribers to beware of representations made by Bell company solicitors. The Cumberland Company officials say that all but five of the Bell subscribers have signed with them. It is predicted that the Bell company will give free service in order to drive its competitors out of business.

Sir Sandford Fleming, Chancellor of Queen's University, Canada, has written a letter to the Right Hon. Joseph Chamberlain, advocating the adoption of a system of State owned cables connecting every British possession and all Great Britain's naval coaling stations. Sir Sandford Fleming proposes three sections of cables, in the Pacific, Indian and Atlantic oceans, and estimates their cost at £6,000,000 ($30,000,000). The first step he suggests is a State owned Pacific cable.

Work has been completed on the extension of the Forman Telephone Company to Hankinson, N. D. The line will be pushed up to Wahpeton as soon as the weather will permit. At present the town of Forman, Lisbon, Sheldon, Enderlin, Puttsville, Milnor, Cogswell, Cayauga, Geneseo, Rutland, Perry, Forsby, Lidgerwood, Hankinson and Alicia are reached by the lines of the company.

At the annual meeting of the Fulton Valley Telephone Company at Fultonham, Schoharie county, N. Y., the reports submitted made so satisfactory a showing that a dividend of 10 per cent. was declared. The officers elected are: President, Dr. J. W. Canaday; secretary, J. H. Weckel; treasurer and manager, C. W. Vroman.

At the hearing before the Committee on Public Improvements at Boston, on the application of the Massachusetts Telephone & Telegraph Company for locations in Boston streets, the local Bell concern, the New England Telephone & Telegraph Company, appeared as a representant, being represented by Samuel L. Powers, who said: "This application is an ingenious one. It is not a modest order. It gives the new company five or six times as much in franchises as your board and its predecessors have given to our company and its predecessors in twenty years. If the new company can furnish the service of the New England Company for $6 a month, it ought to have its desire. This business is one in which the survival of the fittest prevails. To-day we are charging $156 a year for a long distance transmitter, with the right to the subscriber to talk to 19,000 persons. These gentlemen propose to furnish the same quality of service for $72. They must propose to get men to work for five cents a day. Last year the New England Company made on an average on each instrument it maintained but four cents a day, so that it could be seen that the company was doing a very close business. If the franchise is granted, we shall meet the new company, not by cutting prices, but by trying to keep up the quality of our service by employing American labor and paying American prices." Mr. Powers in concluding said the company did not wish to be understood as being remonstrants, but as a friendly rival, and it was ready either to go to the wall or to make a consolidation with the other company and wait for a new comer.

A despatch from Waco, Tex., states that the Long Distance Telephone & Telegraph Company of Texas has been incorporated, with $100,000 capital, to construct and maintain telephone and telegraph lines and exchanges in Texas. The incorporators are C. H. Brown and C. A. Meeker of Kansas City, Mo., and E. Rotan, W. W. Seeley, E. N. Stephenson, J. B. Earle and J. E Boynton of Waco.

At Trenton, N. J., on the 16th inst. the Boston and New York Telephone & Telegraph Company was incorporated with a capital stock of $1,000,000. The incorporators are Zephaniah S. Holbrook, of Cambridge; Oakes Ames, of Milton; Frederick A. Spear and Charles E. Adams, of Lowell, and J. Stewart Rusk, of Boston, Mass.

The board of directors of the Erie Telephone Company have voted to spend $1,000,000 for extensions next year, including additional long distance lines in the six States in which this company operates, and the connection of 10,000 new subscribers, which, it is believed, can be added in the year 1899 to the company's systems.

An effort is being made to establish a telephone company at Adairsville, Ga. It is desired to connect Adairsville with the surrounding towns and the big plantations and peach orchards which encircle the town. About fifty miles of wire will be used.

A bill has been introduced in the House of Representatives at Washington for Government control of telegraph and telephone lines, the same to be acquired by purchase, and appropriating $50,000,000 for extension of existing lines.

The telephone lines from Columbia, Ky., to Campbellville have been purchased from J. O. Russell by Reed & Milley of Columbia. The deal also includes a one-half interest in lines from Columbia to Gradyville.

A new telephone system on the co-operative plan has been installed at Flagstaff, Arizona, and the Sunset Company has withdrawn from the field. T. E. Pollock of the local bank is president of the new company.

The city council of Memphis will, it is believed, at an early meeting, pass a resolution requiring telephone and telegraph companies to place their wires underground in the business streets of the city.

The Western Union reports its estimated net revenue for the quarter ending December 31 as $1,450,000. For the same quarter last year the actual revenue was $1,553,415.

The local telephone companies of Mercer, Lawrence, Butler, Erie, Crawford and Beaver counties, Pa., and Trumbull county, O., have arranged to connect their lines.

New Companies Incorporated.

The Columbia Telephone Company, Columbia, Mo. Authorized capital, $5,000. Incorporators: James A. Hudson, Julia A. Hudson, Ethel A. Hudson, Macon; E. W. Stephens, A. W. McAllister, Columbia.

The Lafayette Telephone Company, Mexico, Mo.—to construct and operate telephone lines. Authorized capital, $12,500. Incorporators: D. P. Moore, M. B. Moore, E. D Graham, E. C. Kennan, P. M. Kennan.

The Thompson & Moab Telephone Company, Thompson Utah—to build and operate a telephone line between Thompson and Moab. Capital stock, $1,400. President, Arthur A. Taylor; vice-president, J. C. Taylor; treasurer, Robert James Thompson; secretary, Charles Wilson.

The Farmers & Merchants' Telephone Company, Warsaw, O.—to operate a telephone system between farms. Authorized capital, $5,000. Incorporators: J. P. Darling, S. C. Kissner, John Fischer, J. F. Rees, L. G. Rees, W. D. Kissner, T. L. Darling, C. L. Lousinger.

The Citizens' Telephone Company, Berea, O.—to operate a local telephone system. Authorized capital, $20,000. Incorporators: S. B. Rawson, J. A. Duke, F. W. Martin, T. M. Brush.

The Flemingsburg & Myers Station Telephone Company, Ewing, Ky.—to do a general telephone business. Capital stock, $600. Incorporators: I. B. Sherwood, W. R. Parnell, Robert Harper, I. N. Price, W. West.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 12.65@12.75c.; Lake, 12.75@13c.; casting, 12.65@12.75c.

The International Bell Telephone Company has declared a dividend of 6 per cent., payable January 4.

The directors of the Ridge Avenue Passenger Railway Company, Philadelphia, on the 14th inst. declared a dividend of $3 per share, payable January 1.

At Detroit a proposition for new thirty year franchises submitted by the street railway companies was rejected by the common council by a vote of 30 to 3.

A stock company has been organized at Cincinnati, with a capital of $500,000, to build an electric road from Cincinnati to Lebanon, a distance of 25 miles.

The New England Telephone Company has reduced its party line service rates in Boston to $48 and $30, the former for three, the latter for six parties to the line.

Stockholders of the Dayton, Springfield & Urbana Electric Railway Company at Springfield, O., have increased the capital stock of the company from $10,000 to $750,000.

The Hestonville Passenger Railway Company of Philadelphia has declared a dividend of $1.50 on its preferred stock and a dividend of $1 on its common stock, payable December 31.

The Westinghouse Electric & Manufacturing Company has declared the regular quarterly dividend of 1¾ per cent. on its preferred stock, payable January 3. Books close December 24 and reopen January 4.

The directors of the Western Union Telegraph Company have declared a quarterly dividend of 1¼ per cent., payable January 16 to shareholders of record December 20. Transfer books closed on the 20th inst. reopen on January 3.

The Denver City Cable Railway, Denver, Col., was sold at auction on the 15th inst., under foreclosure of a mortgage for $4,000,000, to the reorganization committee for $500,000, the minimum bid allowed. The West End Electric Railway was also sold under foreclosure, being purchased by the same parties, for $40,000.

The controlling interest of the Wilmington City Electric Company, Wilmington, Del., has, it is announced, been sold to a syndicate of out of town capitalists. A few of the officers of the company pooled their stock and thus got the control. By the terms of the agreement, it is said, the minority stockholders will be taken care of.

Edward Lauterbach, counsel for the Third Avenue Railway Company, says that the power plant the company proposes to erect at 216th street, New York, will have a capacity of 64,000 horse-power, which will make it the largest in the world, unless the Metropolitan Street Railway Company carries out its intention of making its building a 70,000 horse-power plant. The Third Avenue Company may, Mr. Lauterbach says, go into the business of selling electricity also.

The Fairmount Park Transportation Company, Philadelphia, asked permission to increase its bonded indebtedness $150,000, making an aggregate of $500,000, and the Fairmount Park Commission has given its assent. Senator Porter, president of the company, explained that there was a floating debt of $140,000 and no money on hand to pay it off. The company's earnings had been used to construct a bicycle track and casino, and the new issue of bonds, he thought, was the best way out of the difficulty.

The purchase by John D. Crimmins of a large plot of ground in the neighborhood of Hell Gate has led to the belief that a great electrical power plant will be erected there for the purpose of supplying power and light in the upper sections of the boroughs of Greater New York. It is said that Mr. Crimmins is acting with the Whitney syndicate, and that the above purchase is part of the scheme that the syndicate has in view, that is, control of electrical supply in New York and its suburbs.

The St. Louis papers say that negotiations are on for the sale of the Missouri-Edison Electric Light & Power Company of that city to an Eastern syndicate of which H. B. Holland & Co. of New York form the head. It is understood that an option on the plants, properties and franchises of the company has been given and that the Eastern financiers are now arranging to carry the deal to consummation. The company has $2,000,000 common stock and $2,000,000 preferred, and $4,000,000 of 5 per cent. bonds. Of the bonds, $1,100,000 are in the treasury to redeem a like amount of bonds of the old Missouri Electric Light Company which were outstanding at the time the reorganization was effected.

A syndicate, headed by Col. G. B. M. Harvey of New York, is reported to have purchased the franchise for an electric street railway in Havana, Cuba. The franchise purchased was claimed by the Ferro Carril Urbano Street Railway Company of Havana on an old grant, but they have yielded their rights to the new company at a set price amounting to $1,472,000. Col. Harvey, when asked who are the principal members of his syndicate, said: "Hanson Brothers of Montreal, the Bank of Nova Scotia, the Bank of Toronto and F. S. Pearson of Halifax. Those chiefly interested in New York, aside from Mr. Pearson and myself, are Harry Payne Whitney, W. K. Ryan and Senator Smith of New Jersey."

George Foster Peabody, vice-president of the Edison Electric Illuminating Company of New York, in denying the statement made by John D. Crimmins that that company had sold out to the W. C. Whitney syndicate, said: "Of course all commodities which are bought and sold usually have their price. For instance, I would sell out my interest in the Edison Company for $500 a share, but I have no idea anybody will offer me that price. The new syndicate will not be able to harm our business. Ours is the only large company that is making money, yet we have voluntarily reduced prices. We are now contemplating another reduction which will make it exceedingly hard for Mr. Whitney's company to supply power at a profit."

The consolidation of all the electric, cable and suburban street railways in and around Baltimore, Md., was effected on the 17th inst. by the signing of the necessary papers. The deal was conducted by the Baltimore banking house of Alexander Brown, acting for the Elkins-Widener-Dolan syndicate, in which English capital has a considerable interest. The lines consolidated are the Baltimore City Passenger, the Consolidated, the Baltimore & Northern and the Baltimore, Middle River & Sparrows Point companies. Neither sells to the other, but the properties are merged and will be operated under one management. An issue of 4 per cent. bonds, covering the cost of the City Passenger Railway Company, has been arranged and will be brought out by Alexander Brown & Sons and the Mercantile Trust & Deposit Company. The bonds of the Baltimore & Northern and the Baltimore, Middle River & Sparrows Point Railway companies will not be disturbed.

At the meeting of the board of aldermen at Chicago on the evening which was to decide the fate of the so-called Yerkes franchise ordinances, and on which they were side-tracked by a vote of 38 to 25, the only approach to trouble was during a speech by Alderman McInerney, who was advocating the passage of the ordinances. While he was talking the sound of drums and trampling feet were heard. With blanched faces all listened, but Mayor Harrison sent out and suppressed a drum corps at the head of fifty men. The death of the ordinances was so well assured that the big crowds stayed at home.—At the meeting of the aldermen on the 19th inst., a resolution was passed by a vote of 32 to 31 transferring all franchise ordinances from the committee on streets and railroads to the committee on city hall, and this committee can prevent any further action on them until the Allen law is repealed. This is considered a finishing blow to the Yerkes franchises

ELECTRICITY.

Vol. XV. NEW YORK, DECEMBER 28, 1898. No. 25.

ELECTRICITY.

Published every Wednesday by the

ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.

Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

United States,	$2.50
In Clubs of Five or More,	2.00
Foreign Countries,	4.50
Single Copies,	10 cents

Remit by Express, Money Order, Draft, Post Office Order or Registered Letter.

ADVERTISING RATES:

As Electricity reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application.

Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

EDITORIAL NOTES.

The Old and the New Year. The year which is about to draw to a close cannot justly be said to have been productive of any very startling changes in the electrical industry.

No new electrical patents have been granted that will be likely to revolutionize prevailing systems as did the telegraph and telephone, and with the possible exception of two inventions, one made abroad, the other in this country, nothing of a striking nature can well be credited to the year 1898. As in 1897 Mr. Tesla was credited with having thought out a method of utilizing the sun's heat for the generation of steam, as well as a scheme for removing disease germs from the human body, so for 1898 the theory of transmitting electricity without wires through upper strata of the air and over enormous distances may be placed to his account.

Early in 1898 an Austrian Pole by the name of Szczepanik first startled Europe and then this country by announcing that he had devised a method of seeing by electricity. Considerable was written on the subject at the time, and in fact it attracted the attention of scientists the world over, although comparatively little information regarding the method of accomplishing this wonderful feat was allowed to leak out, it being to all intents the desire of the inventor to withhold all details of the device until it could be given the public through the medium of some international exposition.

Although no very striking changes have taken place during the past year in electric lighting, if we except possibly a greater use of the enclosed arc lamp, due to its having reached a high state of perfection, and the ability to transmit current for lighting purposes over constantly increasing distances and at pressures ranging between 20,000 and 30,000 volts, the lighting industry has been continually growing, as may be gathered from the fact that in 1880 there were but three electric light and power establishments in the United States, employing but about 230 persons, whereas the investment in electric lighting stations in this country to-day is estimated at over $600,000,000.

In the field of electric traction considerable progress has been made. The old year has seen the introduction of horseless carriages to an extent heretofore unprecedented, and what is more, this mode of locomotion would seem to be gradually growing in popularity. As to whether the horseless carriage is proving a financial success is another matter, and would seem rather doubtful from the information that can be gathered. As a motive power for street railways, electricity is more than ever in demand and is rapidly being substituted for every other form especially in New York City and its vicinity.

The year 1898 has unquestionably seen several rather important changes in financial circles of the electrical industry, not the least among these being the reorganization of the General Electric Company by a scaling down of its capitalization brought about to a great extent through the untiring and persistent efforts of Electricity. Unfortunately for the industry as a whole, the year about to expire has also seen an increase in the tendency of large financial interests to gain control of and combine electrical enterprises, ostensibly for economic reasons but really for stockjobbing purposes, which cannot in the long run but work harm to small manufacturers and dealers as well as throw many worthy persons out of employment.

In many respects the year 1898 has been a fairly satisfactory one to the industry in spite of the war, which, as was only to be expected, tied up a large amount of capital that otherwise would probably have been expended in electrical undertakings of various descriptions. There was considerable demand for our electrical machinery in foreign countries. Just how great this demand was may be gathered from the fact that for the fiscal year ending June 30, 1898, the amount of exports represented $2,052,564. Our best customers were Great Britain, France, Argentina and Japan, in the order named. That American electrical machinery is finding ready sale in foreign countries cannot be doubted, and this is undoubtedly due to the comparative cheapness of the United States manufactures owing principally to improved labor-saving machinery.

For the coming year the outlook is certainly more promising than it has been for some time. This country being again at peace with all nations, and likely to remain so indefinitely, it may safely be predicted that there will be a large investment of capital in new electrical undertakings such as the development of water powers and the construction of street railways and lighting plants. A field which it will not do to ignore is that of the telephone, as many new independent companies are being organized each month.

The year 1899 should see a material increase in the export of electrical apparatus, as a more systematic effort will be made to gain a firmer foothold in South America, the far East, and especially China. The general tone of business throughout this country is unquestionably improving, and there are many lines of trade in a very healthy condition. Such being the case, we trust the coming year will find the electrical industry fanned by the zephyrs of prosperity. Hoping to see this laudable desire gratified, we wish all our friends a Happy New Year.

A Transatlantic Telephone System. About a year ago we referred editorially to a scheme that was said to be on foot looking to the establishing of a transatlantic telephone line. The movement was at that time said to be backed by influential capitalists as well as by a number of telegraph and telephone companies. No reliable information was allowed to leak out as to how it was proposed to overcome the seemingly insurmountable difficulties to be met with, but it was asserted that the problem of overcoming static induction which had heretofore been the chief stumbling-block in the way of transatlantic telephony had been successfully grappled with. Nothing further being heard of this proposed gigantic undertaking the interest in it naturally died out. The question was again recently brought up, however, by an article which appeared in one of the daily papers referring to an interview with Mr. Thomas Edison. In this article Mr. Edison stated that he was prepared to construct a telephone line completely around the world providing sufficient capital was forthcoming for the purpose. Fully appreciating the seeming impossibility of overcoming static induction in a long submarine telephone cable, which, as is well known, changes the quick short sound waves into long slow vibrations impossible for the human ear to detect, he suggests a rather unique and decidedly costly method of entirely eliminating all trouble from this source. Mr. Edison, referring to the project, says:

"Telephoning across the Atlantic Ocean will have to be done on new lines. This is probably the feature of the plan that will be most questioned. Inventors have been at work for years trying to send telephone messages across the Atlantic, and have failed every time. Nobody will be able to telephone directly from Europe to America until some force more powerful than electricity has been discovered.

"Rather than attempt the impossible, I tried the plan of constructing cables upon new principles, but I met with the same baffling results. I had, in fact, about given up the task as hopeless when the idea occurred to me that if the length of the cable under water were not so great success might be easier. This led to experiments whose success convinced me that the difficulty would be solved by laying a new cable for telephone purposes only and working it in relays of fifty to one hundred miles or less.

"The idea is to send out sounding parties between the coasts of the two continents for locating shoals. Over each shoal would be anchored a float or ship like the 'lightships' off Sandy Hook and elsewhere."

In other words, Mr. Edison's idea would be to anchor ships at given distances across the Atlantic Ocean, each vessel being used as a relay station. To the best of our knowledge there is no submarine telephone cable in actual use over thirty miles in length, and that would apparently seem to be the extreme distance over which telephone messages can be transmitted with any degree of success. Such being the case, it would require not less than sixty-six relay stations to enable a message to be transmitted between Great Britain and this country. As may readily be inferred, the carrying out of such a project would entail an enormous expenditure of money, and unless the chain of relay stations were located far out of the course taken by transatlantic steamers they would be a serious menace to navigation. Moreover, there would always be a danger of these vessels breaking loose from their moorings during very rough weather, as well as a chance of some of them being destroyed by icebergs. Taking it all in all, although the idea might be successfully carried out by an expenditure of millions of dollars, the results to be derived would seem scarcely to warrant such an enormous outlay of money with the attending risks.

The Disposing of Street Railway Franchises. The granting of several valuable franchises by the city of New York to the Metropolitan Street Railway Company and to the Third Avenue Railroad Company for an extension of its lines is attracting considerable interest, coming as it does just after the recent excitement on the franchise question in Chicago, where the city's interest was protected only after the most extreme measures had been resorted to.

The combination which comprises what are known as the Fort George & Elizabeth Avenue Railway Company, the Boulevard & Eleventh Avenue Railroad Company, the New York & Harlem Railroad Company and the Eighth Avenue Railroad Company, all under the control of the Metropolitan Street Railway Company, applied for a franchise for a double track road, to be operated by underground trolley, along the Boulevard north from Manhattan street to 182d street, which is just north of Washington Bridge. These same companies also desire to construct cross-town lines in 135th street from Madison avenue to Eighth avenue and in 145th street from the Boulevard to the Harlem River. The franchises asked for by the Kingsbridge Railroad Company and the Southern Boulevard Company, both controlled by the Third Avenue Railroad Company, cover the old Kingsbridge franchise, and in part laps over that asked for by the Metropolitan Street Railway Company. The line in question runs from Manhattan street north on the Boulevard to 169th street, thence along Kingsbridge road to the Ship Canal, across the latter as well as over Spuyten Duyvil Creek, through 230th street to Riverdale avenue and north to the city line. Several less important franchises are also asked for, but the above are by far the most valuable.

After the price and conditions of sale have been agreed to by the Board of Estimate, the result will be laid before the two houses of the Municipal Assembly. Here a four-fifths vote of the members is necessary to approve the terms, the final approval of the sale, however, resting with the Mayor. The terms that have apparently so far been suggested are as to whether the city shall accept a gross sum for the franchises or a percentage of the gross earnings of the railroads on the lines granted; or shall the right to operate cars be for but twenty-five years, with the privilege of renewal for twenty-five years more; or shall the city reserve the right to take charge of the railroads at the end of twenty-five years and operate them as a municipal undertaking?

The granting of a street railway franchise for but twenty-five years, even with the privilege of renewal at the end of that period, would scarcely be conducive to good results, as any railway company might naturally hesitate to expend a large amount of money for a first-class road when at the end of a comparatively short space of time its franchise might be withdrawn. As to the city's reserving the right to take charge of the railways at the end of a given period with a view to operating them as municipal undertakings, it should not be thought of for a minute. Municipal ownership of street railways has heretofore not been of a character to warrant such a step being taken. There still remains the plan of accepting a gross sum for the franchises or a percentage of the gross earnings. Either of the last named arrangements would seem to be far preferable to the other schemes suggested, and of the two that of accepting a percentage of the gross earnings is probably the best. If we are not mistaken, there are several franchises in Massachusetts that have been granted in that manner with satisfactory results.

Europe would seem to be appreciating the advantages of the telephone. Frankfort, Brussels, Antwerp, Liege and Verviers are now connected telephonically, and another international line has been opened between Frankfort and Basle.

DEATH OF RONALD T. McDONALD.

We regret to have to announce the death of Mr. Ronald T. McDonald, which occurred suddenly at Dallas, Texas, on the morning of the 24th inst., occasioned, according to the latest advices, by pneumonia. Mr. McDonald was born in 1849, and after serving in the Civil War engaged in mercantile pursuits until 1882 when he entered the electrical field. For a number of years past Mr. McDonald had been a well-known figure in the electrical industry and had ever shown himself a man of indomitable energy and full of resources. His one aim in life was to succeed in everything he undertook, apparently caring little in what manner the results were brought about so long as the desired goal was reached. Many curious incidents are related of Mr. McDonald's experiences which go to show the pluck and resources of his nature when called forth in times of emergency. One of his old-time friends relates the following incident: When Mr. McDonald was in the drygoods business in Michigan, before his entrance into the electrical field, a patron of his in a country town owed him quite a large bill and Mr. McDonald went himself to collect it. On his arrival he discovered to his consternation that the man's place was closed and that the man himself could not be found but it was rumored that he was getting papers ready

RONALD T. McDONALD.

for an assignment. Mr. McDonald hastened to procure an attachment on the goods in the store; the sheriff stated he could not make the attachment as the store was locked and there was no way of getting in. The sheriff added that were the doors open he could readily make the attachment in time to secure Mr. McDonald's claim. Quick as a flash the latter seized a plow that was standing in front of an adjacent store, and using it as a battering-ram broke in the door. The sheriff then walked in and made the attachment and Mr. McDonald saved his claim.

After a successful commercial experience Mr. McDonald started in the electrical business in 1882 in connection with Mr. Charles D. Jenney, now of Indianapolis, and his father. They manufactured arc light machines for a number of years, disposing of them in large numbers to municipalities, at which work Mr. McDonald was an adept. This corporation was known as the Fort Wayne Jenney Electric Light Company, the controlling interest being afterwards purchased by Mr. Coffin for the Thomson-Houston Electric Company. For some time thereafter Mr. McDonald and Mr. Coffin were warm personal friends and conducted together many operations of considerable magnitude. A short time after the formation of the General Electric Company Mr. McDonald became dissatisfied with the manner in which his company was being handled, and organized the present Fort Wayne Electric Corporation, of which up to his death he was president. By exceedingly bright manœuvers he succeeded in getting possession not only of the factory of the old Fort Wayne Company, but of practically all of its assets as well, much to the disgust of the General Electric Company.

During the legal difficulties which arose over the acquisition of the assets of the old Fort Wayne

company, Mr. McDonald leased the Wenstrom factory in Baltimore and used it as a club to bring the General Electric Company to terms. In addition to his interests in the Fort Wayne Electric Corporation, Mr. McDonald was a large owner in the New Orleans Edison Electric Light Company as well as in the New Orleans Artificial Ice Plant. He was also a stockholder in the Hoffman House, New York, a large owner, with Mr. Samuel Insull of Chicago, in the Fort Wayne Lamp Company, and other enterprises.

Mr. McDonald was a man of untiring energy, one of the greatest "hustlers" in the electrical industry and withal a pleasant and agreeable companion. By his death the industry loses a man who made his mark on the pages of its history even if the mark was sometimes blurred by methods that subjected him to severe criticism. He was a resident of Ft. Wayne, Ind., where he leaves a devoted family to mourn his untimely death.

Under the Searchlight.

Notes and Comments on Various Topics.

PROF. W. C. ROENTGEN, the inventor of X-ray photography, has been offered a chair in the faculty of philosophy in the University of Leipsic.

* * *

IT is true, according to the Boston *News Bureau*, that the Rev. P. F. Jernegan, of Electrolytic Marine Salts fame, has returned to this country $75,000 which has been deposited beyond attachment but in such a way as to be the basis of negotiations for his return to this country. "It is understood," says the *Bureau*, "that Mr. Fisher, his partner, received a considerable amount of money paid to Jernegan, and Mr. Fisher's whereabouts are as yet unknown. Besides the $75,000 there is also $99,000 of Mr. Jernegan's money 'held up' in this country in the interest of the company. The company itself has $101,000 cash, $5,000 worth of bullion, $2,000 worth of platinum wire, three houses and two plants at North Lubec. Messrs. Sawyer and Usher, the fiscal agents of the company, also have $113,000, which is available for the stockholders provided all the stock is turned in and there are no complications. There is against this money only $18,000 of debts and 950,000 shares of stock outstanding. The company thus has in sight cash assets of $377,000, or nearly 40 cents per share, that with smooth sailing should be available to shareholders."

THERE are now at least two electric delivery wagons running in New York City, trim and handsome vehicles both of them, with electric side lights and electric lights inside in place of the lamp or lantern commonly carried. The bodies are very similar to those of ordinary delivery wagons, but besides they have pneumatic-tired wheels, lower than those of the usual wagon.

* * *

ACCORDING to the *Milwaukee Sentinel*, Mr. Samuel W. Watkins, who is manager of a firm that manufactures tanks which hold compressed air, and who has made a study of compressed air power, states that there is little or no economy to be hoped for through the operation of street cars by compressed air in view of the development and possibilities of electricity. Mr. Watkins says that a compressed air system of cars would not only cost more to build than an electric car line, but the operating expenses and the wear and tear would be much greater because of the delicate and accurate machinery that is needed. Providing the above proves to be the case, it looks very much as though Mr. Joseph Leiter was on the high road to another failure.

THE PURIFYING AND STERILIZING OF WATER BY OZONE.*

Water is undoubtedly one of the most important articles of human subsistence and yet strange to say it is water which is the principal agent in propagating contagious diseases; thus nature apparently feeds the human race in a manner that entails almost certain death. However, if man would take the trouble to examine his conscience he would not fail to perceive that he is to a great extent responsible for this wholesale poisoning by water, for does he not throw into streams all manner of organic matter which he does not know how else to dispose of? Fire purifies everything; he is aware of this fact and yet does not make use of it, and in this he is culpable, preferring, it would seem, to poison his neighbors, who one may be sure will do him the same bad service. Health societies and physicians have repeatedly cried out against this dumping of filth in water courses; but what can be done to eradicate a bad habit that has been for years taking root? Can we prevent those who dwell along a river's bank from throwing into the stream which passes before their doors all that of which they wish to be rid? As for ourselves we do not think there is any way possible. Thus the question of sterilizing, or at least purifying the water was brought up, for it is absolutely necessary that the microbes which dwell in the water in innumerable quantities, awaiting a favorable opportunity to ingraft themselves in man's system, which offers an extremely favorable field for their development, should be destroyed at any cost. Filters have had their day, their inefficiency being generally recognized, as they only serve to remove the impurities held in suspension in the water while allowing the most deadly microbes to pass.

Pure air is a medium rather unfavorable to microbes, but the more deadly manage to exist in it; where however they no longer can exist is in ozone, whose beneficent effects are already beginning to be recognized. Thus the idea of circulating ozone through water, in which disease germs are almost invariably present, has been thought of with a view to destroying them almost completely. This may be achieved in several ways, but we will only speak for the present of Mr. Tindal's system which has so far given very remarkable results. That system is explained as follows: Before the air is made to pass through the volume of water to be purified it is subjected to the action of a high tension electric current obtained from a dynamo similar to those made use of for lighting purposes. The voltage is raised by means of specially designed transformers. The currents employed by Mr. Tindal at the municipal works of Saint Maur, where his system is now in operation, have a potential of from 50,000 to 100,000 volts. The electric current is led to specially designed receptacles where a current of dry air is made to circulate, and it is in these receptacles that a greater portion of the air is transformed into ozone. This ozonized air is then transmitted by means of an air pump to large columns or receptacles known as sterilizers in which the water to be purified enters at the same time as the ozonized air. In order to insure a thorough mixture of the air and water—that is to say, in order that each molecule of air should come in contact with at least one molecule of water, and on the other hand to allow time for the sterilization to take place, there have been placed in the sterilizers, at every fifty centimeters, celluloid plates pierced with innumerable small holes. By this arrangement the water is broken up into fine drops and circulates but slowly. The sterilizers installed by Mr. Tindal at the municipal works of Saint Maur are shown in Fig. 2. After leaving the sterilizers the water, then in an absolutely pure state, is collected in a small reservoir from whence it is distributed to Paris by means of pumps. The works of Saint Maur, of which a general view is given in Fig. 1, are capable of furnishing 100,000 meters of sterilized water per day. The cost of sterilizing a cubic meter of water, according to Mr. Tindal, amounts to less than .14 of a centime (about .028 of one cent). Moreover, Mr. Tindal is of the opinion that for other installations the above figures could be reduced by one-half. As may be seen, the above is a very small amount to expend when the health of the inhabitants of a large city is taken into account, especially as the amount expended in this way would be to a great extent offset by a saving in doctor's bills, to say nothing of an almost certain decrease in the mortality.

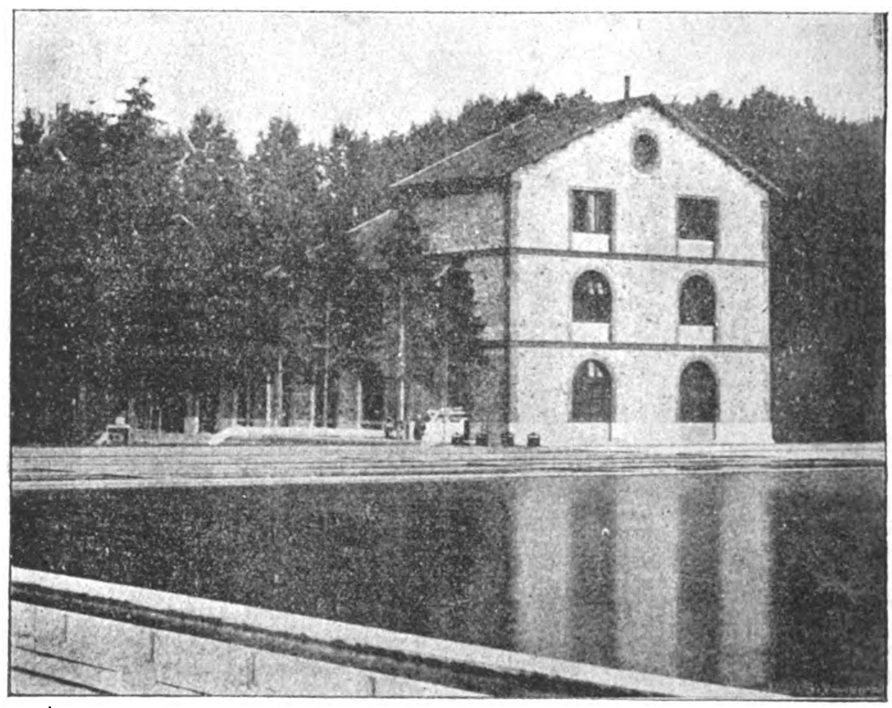

FIG. 1.—GENERAL VIEW OF THE SAINT MAUR WORKS NEAR PARIS.

Towns and small cities about to erect plants for lighting purposes could thus, apparently, with the same dynamos, purify their water supply. From an economical standpoint, therefore, Mr. Tindal's system would seem to offer many advantages.

Let us now say a few words as to the results obtained by Mr. Tindal from a bacteriological standpoint. With this object in view we will refer to a number of experiments made with extremely de-

* Translated from *La Vie Scientifique*, Paris, for ELECTRICITY.

fective apparatus at the International Exposition of Brussels. The plant in question allowed of about 700 cubic meters of water being treated, which was taken from the city's supply. The water of Brussels, coming as it does from great depths, has in it comparatively little organic matter (.045 to .075) and but few microbes (500 to 1,000 per cubic centimeter). In the various tests that were made it was found that the water was completely sterilized after its treatment with ozone.

Experiments were also made with water taken from the Ostend supply, from the Plassohendaele canal and from the Bruges canal; these waters are all rich in microbes. The Ostend water contains 6,848 per cubic centimeter, that from the Plassohendaele canal 389,280 and that from the Bruges canal 1,430,000. The analyses of the various samples however, after being subjected to the ozone treatment, showed them to be absolutely sterilized.

POLYPHASE TRANSMISSION OF POWER.*

BY F. WALLIS.

The transmission of energy by polyphase currents has made much greater progress abroad than it has in this country, and in addition to our national conservatism in adopting new methods there are two main reasons for our backwardness. In the first place, there are but few sources of water power in Great Britain, and recently steam power can be obtained comparatively cheaply all over the country. In Switzerland and in America, where long-distance transmission has made such strides, water power in large quantities is constantly to be met with, and is naturally taken advantage of; while again, in the mining districts of both America and South Africa, fuel can often only be obtained at very great cost, and consequently it is cheaper to transmit power over a great distance from one large center, where water power or fuel can be more easily obtained, than to have a number of isolated plants.

Nevertheless there is a considerable field even in this country for the transmission of power in large quantities over long distances—say 20 to 40, or even 50, miles—for not only might great generating stations be erected near the coal pits, where fuel can be obtained delivered to the boilers at 2s. 6d. per ton, but further, the enormous power that runs to waste in our blast furnaces might be in part utilized for the generation of electricity. It has been estimated that, for every 100 tons of metal cast, energy sufficient to generate 2,000 HP. for one week is wasted in blast-furnace gas, and that throughout the country about 2,000,000 HP. is thus wasted.

But quite apart from such problematic schemes there are many cases in which polyphase transmission might be advantageously employed. For instance, at Dublin where the generating station is only seven miles from the furthest sub-station and the pressure employed is only 3,000 volts, polyphase transmission has been found to give admirable results. Indeed, wherever it is desirable to work at a pressure of 2,000 or 3,000 volts or more, polyphase transmission offers many advantages. Again, in many cases where the generating station is within a few hundred yards of the area of supply, the polyphase system may be profitably adopted, owing to its suitability for motor work. This particularly applies to the case of the transmission of power in works where motors form the chief part of the load. And it must be borne in mind that even though there may not be many openings for long-distance transmission at voltages of 10,000 or so in England, many such transmissions are required in the colonies and elsewhere abroad, and it is preferable that the necessary plant should be installed by English engineers.

The question thus arises, What is the greatest distance to which electrical energy can be economically transmitted, and how do the various systems of transmission compare with one another? The largest circuit yet employed has been the experimental one between Frankfort and Lauffen, a distance of 100 miles, over which 300 HP. have been transmitted at 3,000 volts, three-phase currents being employed; 4,000 HP. have also been transmitted on the three-phase system at 10,000 volts over 24 miles at Sacramento, and 1,400 HP. at 11,000 volts over 35 miles at Fresno, Cal., not to mention the Niagara-Buffalo line, and many others. There are also several two-phase lines at work. Of single-phase alternating lines, that at Rome may be mentioned, where 2,000 HP. are transmitted at 6,000 volts from the Falls of Tivoli, 18 miles distant from the city. M. Thury and others have also installed several long-distance continuous current plants, of which that at Geneva, where 400 HP. at 6,600 volts are transmitted over 20 miles, is the longest, though the Brescia line, over which 700 HP. are transmitted 12 miles, is worked at the highest voltage, namely, 1,500. In the case of many of these transmissions, where water power is employed, it must be remembered that the power available is greatly in excess of that required, and consequently very considerable losses in the line and plant could be permitted.

Abroad, transmission of power is almost invariably carried out by bare overhead wires. In England no such transmission on any large scale has yet been tried, and it is more than probable that the Board of Trade would insist on insulated cables being laid either underground or by the side of a railway, or in some such thoroughly safe and efficient manner, whenever a high voltage was employed. And in many ways this would be an advantage, for any long-distance transmission would necessarily be on a very large scale and any breakdown which might easily occur with overhead wires would cause great loss to the community. Further, overhead wires have great inductive effects, and in a crowded country like England would cause much trouble. The underground mains would, of course, be either concentric or laid very close together.

In other countries the conditions are, as a rule, entirely different. The chief consideration is generally small first cost, and consequently bare overhead conductors are almost universally employed. But even with these there are limits to the voltage which may be employed; not, indeed, in the apparatus at the ends of the line, for transformers can be made to safely stand almost any voltage, but in the line itself. In a very dry climate 20,000 or 30,000 volts may be safely employed, but in a damp and foggy atmosphere, even 10,000 volts may be too high for satisfactory working, owing to moisture collecting on the insulators, and so causing short circuits.

But, granted a long-distance transmission, the question still remains, How does the polyphase system compare with the direct-current and with the single-phase alternating? Now, though direct currents have been employed by M. Thury over considerable distances at very high pressure (e.g., the 15,000 volts at Brescia), there are many disadvantages connected with such a system. In the first place, as M. Thury himself states, the maximum output of a high-pressure continuous-current dynamo is about 45 amperes at 3,000, or at most 4,000 volts; hence, for generation at 15,000 volts, four or five machines must be coupled in series; and likewise, wherever it is desired to tap the mains, another four or five machines in series must be run as motors, each either helping to drive a common shaft, from which a large generator may be driven to supply the lower potential current required for distribution, or driving its own smaller generator direct. In other words, large units with the corresponding gain in efficiency and in first cost cannot be employed with the continuous-current system. And, further, since commutators must be employed at the full potential of line, the risk of accident to the attendants or to the machines themselves is very great. On the other hand, the employment of the direct current admits of a saving in the weight of copper in the line as compared with any of the alternating systems, the relative figures for direct current, single-phase, two-phase, four-wire and three-phase circuits being 0.50 : 1.00 : 1.00 : 0.75, assuming the same maximum potential difference in each case. As a matter of fact the gain in copper is even greater, for in almost all alternating circuits the power factor is less than unity, and consequently a greater current has to be carried than corresponds to the power transmitted. On the other hand, in the above figures it is assumed that the maximum alternating EMF. is $\sqrt{2}$ times the effective EMF., and though this is approximately true it should be remembered that the disruptive dis-

*From the *Electrician*, London.

charge due to an alternating EMF. is sluggish; that is to say, does not at once follow the applied EMF., so that, to take an instance, an alternating EMF. of more than $\frac{15,000}{\sqrt{2}}$ effective volts is required to produce the same disruptive effect as a continuous-current EMF. of 15,000 volts. Further, there is no electrolytic effect with an alternating current, nor does the osmotic effect, whereby moisture creeps to the negative pole of a continuous-current circuit, exist. Of course, with underground cables these effects would not, under normal circumstances, be present; yet should by any chance a minute leak develop they would at once manifest themselves.

On the whole, in the majority of cases it will be found that though there would be a considerable saving of copper in the line, the continuous-current system is placed out of court by the fact that the generators and motors have to be split up into comparatively speaking small units, and that a considerable element of danger is always present owing to the necessarily more or less exposed commutators being at high potentials above the earth.

The single phase alternating system is well adapted for the transmission of power over long distances when it is simply a case of one receiving station where the one or two large motors convert all the energy at once into its mechanical equivalent. In the text-books it is shown that the system requires more copper in the line than the three-phase, the proportion being 100 to 75; but, as large single-phase motors, such as have just been referred to, are always synchronous and there is practically no lagging current in the line, whereas with a three-phase transmission the power factor will rarely exceed 80 per cent. and the line wires have to be increased proportionately in size, it follows that there will not in practice be much difference in the weights of copper employed. The real objections to the single-phase system are two in number—first, that the motors employed have to be of the synchronous type, and secondly, that rotary converters designed to transform single-phase alternating current into continuous current cannot be built for an output much above, say, 50 kilowatts, on account of the excessive sparking at the commutator, this sparking being due to the great fluctuations in the alternating current in the armature. A synchronous motor might, of course, be arranged to drive an entirely separate continuous current dynamo and the sparking difficulty so got rid of, but the cost of the two machines would considerably exceed that of a polyphase rotary converter, and the efficiency of the conversion would be lower. But the chief objection to the single-phase system is undoubtedly that first mentioned, namely, that synchronous motors have to be employed which cannot be started without external aid, and further require separate field excitation. This does not matter so much in a large transmission, where power is simply sent from one end of a line to the other in large quantities, for in such a case the cost of the exciter, and of the battery of accumulators or the small non-synchronous motor required for starting purposes, does not bear a large proportion to the total cost of the installation, nor is the extra attendance required for these a serious item. But where only small motors are concerned such complications become prohibitive; and though many induction and other self-starting motors have been brought forward, none have yet proved themselves sufficiently satisfactory for general adoption, or at least, as a matter of fact, have not yet been generally adopted. It should be added that synchronous motors may be started not only by small subsidiary self-starting motors, or by driving their exciters as motors from a battery of accumulators, but also by supplying the exciters from the alternating current mains when, provided their field-magnets are laminated, they will run as alternate-current motors. But this method involves the use of the laminated fields and other complications, and does not seem to be often employed.

With the polyphase system the difficulty of self-starting is entirely done away with. Even synchronous polyphase motors will start themselves, owing to the reaction of the eddy currents induced in the solid pole-pieces—provided the pole-pieces are solid and not laminated at the tips, as is often the case; but as the resulting torque is not very great, the motors have to be started light and the load only thrown on when they are running in synchronism. Synchronous motors have the great advantage of a power factor of nearly unity when properly excited, and hence, if three-phase synchronous motors are employed, there is a saving of 25 per cent. of the line copper over the single-phase system. But in spite of their lower power factor, induction motors are far more generally employed on polyphase circuits. With these there is no difficulty in starting, even under full load. Small motors up to 10 HP. or so are generally made with squirrel-cage rotors, and these when starting under full load take for a short time a current of two or three times the normal full load value. Larger machines are provided with a variable resistance in the rotor circuit, and will start under full load, taking only the normal current. For cranes and hoists the rotors are wound to have a considerable resistance and a starting torque of even five times the normal can be obtained.

Further, the polyphase system has the advantage of being peculiarly well adapted for use with rotary converters. A three-phase current can thus be transformed into a single-phase, a two-phase or a continuous-current, though for conversion into single-phase or two-phase it is far simpler and more efficient to use static transformers. For conversion into continuous current, however, rotary transformers must be used, and since in polyphase systems the flow of power is constant there is no difficulty with sparking at the commutator. Indeed, the tendency to spark, and the demagnetizing effect of the armature, is far less than with continuous current dynamos, since the armature reactions of the two circuits tend to neutralize one another. Thus we are told that the 600 kilowatt converters at Niagara will give 900 kilowatts without sparking.

It is rather a drawback to the use of the rotary converter that as a rule it requires a static transformer to reduce the polyphase voltage before it reaches the machine. The reason is that continuous currents are always required at low voltage, and a rotary converter with only one armature winding has a fixed ratio between its polyphase and continuous current voltages, the former being lower than the latter. But even were any voltage ratio possible it would still be undesirable to introduce high potential currents into a revolving armature, and static transformers would have to be employed. From what has been said it must not be inferred that static transformers must necessarily be employed with motors, for such is not the case. The polyphase circuits can be, and in large sizes generally are, led into the stationary portion of the motor, where they can be as well and safely insulated as in a transformer itself. Small motors, however, cannot be wound for high pressure except at prohibitive cost—the limit for a 20 HP. motor being about 1,000 volts—and with these static transformers must be employed.

Thus in a large transmission system large motors will take current direct from the high-pressure mains, while for smaller motors one or more distributing centers with large static transformers will be established. Lamps may also be run from the low-pressure polyphase circuits, being connected either between the three mains in a three-phase system, or preferably between each of the mains and a fourth balance wire running to the junction of the three circuits on the low-pressure side of the static transformer, in which case the latter must be star wound. In a balanced three-phase system the sum of the three currents is always zero, and so a fourth return wire is unnecessary, but where the load may be unevenly distributed, as is the case when lights are run from the mains, a fourth wire will take the unbalanced current and the voltage regulation is more satisfactory than if no return wire were used. As against the extra weight of the return wire this system has the advantage that the voltage between the mains is raised to $\sqrt{3}$ times that required by the lamps, and consequently the mains themselves take less copper. On the other hand, in many cases in practice there is no difficulty in obtaining a good balance even without the complication of a fourth wire. The motors on the circuits act as automatic regulators, for should the voltage between any pair of mains fall owing to extra lamps being switched on to that circuit, the current in the corresponding branch of the motor windings will fall. The back EMF. in these branches will rise and the current still further fall, while at the same time the currents in the other two branches on the motors will rise to make good the deficit, and the voltages will once again become approximately equal. Nevertheless, many engineers prefer the two-phase system with four wires, where, as the two circuits are electrically independent of each other, they can be independently regulated. The lamps are then each on their own circuit, and only in the motors are the two phases brought into play. For this reason it has been suggested that it would be better to employ three-phase transmission in the line on account of the saving of copper (the weight for the same maximum potential difference as compared with the two-phase 4-wire system being in the proportion of 75 to 100) and at the receiving points to transform by static transformers to the two-phase system.

A third method is to transform from three-phase to continuous currents by the use of rotary converters, and much can be said in its favor. In the first place, rotary converters can be made to act not only as transformers, but also as boosters, for the field winding may be compound and sufficient series turns employed to actually make the full load voltage greater than at no load, the phase relations in the polyphase circuit being altered thereby. Again, the periodicity of the polyphase circuits may be too low for the satisfactory working of lamps (neither arc nor incandescent lamps should be worked under 40 revolutions per second), and then the only thing to do is to distribute by continuous currents. Further, the regulation of a continuous current voltage is easy, and, of course, continuous current motors work satisfactorily. Such a combined system is particularly well adapted for traction purposes where, on account of induction troubles and of three-phase currents requiring at least two trolley wires, it is as a rule impossible to use anything but continuous currents for the working of the cars. On the other hand, the use of the polyphase system throughout is in many cases more satisfactory. Where motors alone are to be driven the conversion to continuous current is quite unnecessary; for, as has been said, large motors can be supplied directly from the high pressure mains, and smaller ones only require static transformers in place of the more costly and less efficient rotary converters. Where, however, the distribution is mixed, that is to say, where motors and lights have to be run from the same circuits, the question is not so easy of solution even when the frequency is high enough for lighting purposes. Although in some cases, as has been mentioned, the regulation of voltage on polyphase circuits has been found to be a comparatively simple matter, the experience obtained has perhaps not yet been sufficient for us to say that this will always be the case, and it may be taken as a maxim that wherever regulation will be a difficult matter requiring great care and attention it will be more economical in the end to install some simpler system even at an increased first cost. Again, though accumulators may be charged by means of rectifiers or

rotary transformers from alternating circuits, their use is almost entirely confined to continuous current distribution.

So far as the motors are concerned the polyphase system more than holds its own. Not only will induction motors start under full load, but their regulation is an easy matter. Synchronous motors will run at absolutely constant speed no matter what the load, and well-designed induction motors of from 2 HP. to 100 HP. drop only from 8 per cent. to 4 per cent. in speed at full load. They thus act like continuous-current shunt motors. Their efficiencies between these sizes vary from about 76 per cent. to 92 per cent., and could be designed to be greater still. As a rule, the regulation of speed is effected by a variable ohmic resistance in the rotor circuit, though in cases where large starting torque is not required, auto-transformers, which inductively reduce the voltage of supply, are often employed. Alteration in speed may also be effected by alteration of the number of stator poles, by changing the connections from star to mesh, and by coupling two motors together, so that the rotor current of the first machine supplies the stator of the second. As a rule, however, regulation is effected by altering the resistance of the rotor circuit, though this method has the disadvantage that when carried out to any large extent the efficiency is considerably reduced. The polyphase motor has, further, the great advantage over the continuous-current motor of requiring no commutator. It is also of very strong mechanical construction, and requires little or no attention. Likewise for equal power its weight is less than that of the direct-current machine, while at the same time it can stand very considerable overloading for a short time. There is very little difference in efficiency, power factor, starting torque, and exciting current, between the three-phase and the two-phase motor, what slight difference there is being in favor of the three-phase.

A great deal has been said concerning the low power factor of polyphase systems. For transmissions in which the load consists chiefly of induction motors, the factor varies from 0.65 to 0.85. As a rule it will be about 0.75 or 0.8. The motors and transformers, and not the line, are the chief sources of the lag of current behind the EMF., though the result of a low power factor is increased size of plant all round. The coil can, however, be compensated for to a considerable extent by the employment of a few large synchronous motors, which not only have no lag when properly excited, but when over-excited will still run as motors, with the current leading the EMF. They then in fact act as condensers. One American firm actually sends out condensers with its motors, but generally speaking the condenser cannot yet be regarded as a commercial article. In the matter of power factor the advantage of the three-phase over the two-phase motor is so small as to be practically negligible. It must be remembered that as the load decreases the power factor also decreases, so that when the motor is running light and absorbing but little energy the current it takes is still 20 to 30 per cent. of the full load current.

With the introduction of polyphase motors frequencies have fallen considerably from those of 100 cycles per second, and more, employed some years ago, for electric lighting. The higher the frequency the cheaper are the transformers; but on the other hand, if a motor is to run on a high-frequency circuit at a given speed, it must have an increased number of poles, and this, in small sizes at least, means increased size and cost. Further, the higher the frequency the greater the magnetic leakage and the magnetizing current required. Also, the higher the frequency the greater is the skin effect in conductors, and consequently the more finely must they be subdivided. At Niagara a periodicity of 25 has been adopted, and this is but little lower than that of the majority of polyphase transmissions in America. In Europe a rather higher figure, of somewhere over 40, is more general, in order that the circuits may be employed for lighting as well as for motive purposes.

SUPERHEATED STEAM AND ITS APPLICATION ON STEAM ENGINES.*

BY PAUL SCHOU.

Mr. Schmidt, of Cassel, was the first engineer to introduce a complete plant working with highly superheated steam. The task was a difficult one. Mr. Schmidt was working for fourteen years before he was able to construct a plant to withstand the most severe test. The result has been very striking indeed, and now over 200 complete plants are working satisfactorily in various parts of the world. That superheated steam can also be used for large plants may be gathered from the fact that a 750 HP. compound engine plant has been running now for 3½ years, night and day continuously, without the slightest hitch. The engine is used for a mill rolling fine steel sheets, and the power given off by the engine varies from 400 to 750 HP. The economy has been remarkable, namely, only 8¾ lbs. of steam being used per indicated HP. per hour. The boilers are heated by producer gas, the consumption being equal to 1 lb. of coal per indicated HP. per hour. This result, without doubt, is the best ever obtained on any steam engines in the world. As a proof that this plant has been a success, the existing steam power will be replaced by a Schmidt plant of 4,000 HP.

The economy for smaller plants has also been very remarkable. The writer has made very careful tests on a 70 HP. tandem compound engine, which is driving an ice factory in Ireland, and the steam consumption was 10.2 lbs. per indicated HP. per hour, and the coal consumption 1.4 lbs. per IHP. per hour.

The difficulties which had to be overcome, before making it possible to construct plant to work with highly superheated steam, have been, first of all, to construct the superheater in such a way that the tubes in which the steam is superheated would withstand the high temperature of the gases; and secondly, the proper lubrication of the working parts of the steam engine.

As, however, it is now possible to obtain a mineral oil with a flashing point of 380 to 400 degrees centigrade, the difficulties which were met with many years ago have disappeared. Even with this special oil, the best way of lubricating the gearing for admitting steam into the cylinders and the piston rings had to be devised.

Most of the steam engines, working with highly superheated steam, have been single acting, so as to prevent the piston rings coming into contact with the steam during the admission period. The most interesting type of this kind and the one which has given the best result, is the Schmidt tandem compound engine.

The pistons for the high and low pressure cylinders are made in one piece; the front part of the cylinder forms the receiver, the ring space being the low pressure cylinder. The steam enters the high pressure cylinder, forcing the piston forward; when the piston moves back the steam is led into the receiver. On the next forward stroke the steam passes from the receiver into the low pressure cylinder. Although the high and low pressure cylinders are single acting, the engine is, to a certain extent, double acting, through the novel arrangement of the receiver in which a certain part of the work is performed.

The construction of this engine adapts itself very well to working with steam at high temperatures, for the following reasons:

1. The high pressure cylinders require no steam jackets.
2. The heat taken up by the high pressure cylinder walls during the admission period is not lost, but serves to heat the receiver.
3. The low pressure cylinder is heated by the receiver steam.
4. The high pressure piston is cooled inside by the receiver steam.
5. There is but a single stuffing box, which is only in contact with the receiver steam. The lubrication, therefore, is the same as an ordinary engine. At first sight, it may be said that this engine has one drawback, viz., that the high and low pressure cylinders are only separated from each other so long as the piston rings in the high pressure cylinder keep tight. The difference in pressure between the high and low pressure cylinders is, however, not so great as to make it difficult to keep the piston rings tight, when one considers that when the steam is admitted to the high pressure cylinder, the low pressure cylinder is connected to the receiver and that there is only vacuum in the low pressure cylinder when the high pressure cylinder is connected to the receiver.

There are various other arrangements in compound engines, viz., a single acting high pressure cylinder, and a double acting low pressure cylinder, but of course with all these types of engines, if adopted for very large powers the cost is rather high on account of the superheated steam only working in a single acting cylinder. Schmidt, therefore, has made experiments to use superheated steam in double acting engines, which, however, is only possible after introducing quite a new way of using the steam. This new idea consists in superheating the steam according to the degree of expansion in the cylinder, which is done in the following way: Two steam pipes are led to the cylinder, one coming from the superheater and the other direct from that part of the boiler where saturated steam is produced. The governor on such an engine has two duties to perform, viz., to regulate the degree of expansion and to regulate the temperature of the steam.

To regulate the temperature a valve is fixed in the pipe containing the saturated steam, which is connected by levers to the governor. When working with a very short cut off only superheated steam is admitted to the cylinder, and as the degree of expansion increases the governor opens the regulating valve, allowing a certain amount of saturated steam to mix with the superheated steam, lowering the temperature of same; by this arrangement any temperature required may be easily obtained.

The principal object of this idea is to make it possible to produce a low mean temperature of the cylinder walls, so that steam of high temperatures may be used with safety. In double acting engines, the idea to superheat according to the degree of expansion has been carried still further, by also superheating the steam in the receiver, between the high and low pressure cylinders. All the superheated steam enters through a pipe into the chamber arranged at the end of the receiver. If the engine is working with a short cut-off, the superheated steam passes straight into the high pressure cylinder, but as soon as the degree of expansion increases, a valve which is connected to the governor is lifted, allowing a certain portion of the superheated steam to pass through the receiver coils, passing first into a chamber and returning therefrom, arrives at this point in a saturated condition. It then passes through other parts underneath a valve, mixing with the superheated steam and lowering the temperature of same. The steam passing from the high pressure to the low pressure cylinder through the receiver does not come into contact with the superheated steam.

By this arrangement you will see that on the one hand the more steam is used in the high pressure cylinders, the more steam, of course, will pass through the receiver to the low pressure cylinder; but on the other hand, less superheated steam is required in the high pressure cylinder, and therefore more will be available for heating the steam passing through the receiver to the low pressure cylinder. In other words, it does not matter with what degree of expansion you work, the heat applied to the steam in

* Abstract from paper read before the Northern Society of Electrical Engineers, Manchester, Eng., Dec. 8, 1898

the superheater is always utilized in this arrangement, without loss.

A large plant is now working in Russia, very satisfactorily, constructed on this principle, and although no exact tests have been made, Mr. Schmidt expects the steam consumption to be only 8 lbs. per IHP.

Having now described the steam engine, I will proceed to describe the superheater.

The Schmidt superheater consists of a series of lap-welded wrought-iron tubes, varying in diameter from 1 in. up to 2 in., according to the size of superheater—the coils being welded together in long lengths, so as to prevent any joint coming into contact with the flue gases. The coils are formed in either a spiral or zigzag shape, to suit existing circumstances.

The superheaters may either be arranged in the flue behind the boiler or altogether separate from the boiler plant, the latter type being fired direct, either by coal or gas; either kind of superheater may be attached to any existing boiler.

In the superheater arranged in the flue behind the boiler the steam travels through the superheater coils in the following way: Suppose the gases from the boiler enter the superheater from the top, then the saturated steam from the boiler is led into the superheater through the bottom coil, and travels through one-half of the coils in the opposite direction to the gases, and is then led to the top coil of the superheater, arriving there perfectly dry, but not superheated. The steam then travels in the same direction as the gases, being led off from the superheater at about the middle of the coils. By this arrangement, the coils, which are placed nearest to the gases having the highest temperatures, are cooled inside by the steam preventing the coils from becoming too highly heated. This, of course, is the only way to prevent deterioration for any length of time. Further, all the heat of the gases is utilized as economically as possible.

I should like here to say a few words about the economizer invented by Schmidt, which he arranges behind the superheater, so as to still further reduce the temperature of the gases before same enter the chimney. The principal of this economizer is to work with distilled water in the coils arranged in the flue and passing the distilled water through the feed-water heater. The advantage of this economizer is its great simplicity, it being possible to make the coils in long lengths, as no corrosion takes place inside them, and therefore no cleaning is required. Further, the feed water being heated indirectly by the distilled water passing through the economizer, the temperature of the distilled water returned from the feed-water heater is sufficiently high that the vapor contained in the flue gases coming from the boiler does not condense when coming into contact with economizer coils. The result is that the soot does not adhere to the coils and may be blown off with a small jet of steam in the course of a few minutes, say every week or fortnight, according to the nature of the coal.

The direct fired superheater referred to above is constructed on the same principle; the gases entering the superheater from below and traveling in an upward direction. This type of superheater is specially applicable to cases where a boiler plant already exists, the only alteration required being to lead the steam through the superheater instead of direct from the boiler to the steam engine. Even although extra coal is used for heating the steam, a total saving of 20 to 25 per cent., even on the best compound engine, can be obtained from adopting this kind of superheater.

Before concluding I may say that, especially for steam engines driving large electricity supply stations, there is a great future for the utilization of superheated steam, as the heavy losses which now take place on account of the steam engine having during certain parts of the day to work with only half loads, can be prevented by adopting the Schmidt system, and I hope I have been able to show that the practical difficulties attached to this system have been overcome.

In your own town, Manchester, there will shortly be laid down two boilers, each being connected with a Schmidt superheater—each plant being capable of producing ten thousand pounds of steam per hour. The boilers will be heated by Mond's producer gas, and the steam will drive a 1,000 HP. Raworth engine to be used for electric traction.

SOME REMARKS ON THE PERFORMANCE OF ELECTRICAL APPARATUS ON SHIPBOARD DURING THE LATE WAR WITH SPAIN.*

BY F. W. ROLLER.

In addressing the Society this evening, let me preface my remarks with the statement that much of what I shall have to say is based on hearsay evidence, as is necessarily the case, but the opinions of the numerous other officers with whom I have spoken on the subject seemed to agree so well that I believe you may take the conclusions as generally correct.

In the first place we will divide the electrical appliances that we had into two different classes and compare them.

The first of these will include the indicating apparatus such as the engine room and order telegraphs, speed and direction indicators, helm angle indicators and the range finder. All of these instruments are of the galvanometer type, there being a galvanometer at the receiving end with its scale divided in yards range, degree, revolutions or arbitrary orders instead of volts or amperes, and actuated by differences of potential produced at their terminals from the sending end. They are in consequence delicate in construction and easily get out of adjustment, but they have the advantage of flexibility and possibility of the use of a large number of receiving stations as well as the minor one of requiring inappreciable amounts of energy.

In general it may be said their performance was not satisfactory. In some cases, say that of the range-finder, the trouble cannot be attributed entirely to electrical reasons. In this instrument, where we in reality measure the altitude of a triangle from the known base line (the distance between the two telescopes) and the angles adjacent thereto (those made by the telescopes with the base line when bearing on the target), the base is so very short in comparison to the other two sides that unless the glasses are very carefully trained and the whole apparatus in perfect adjustment a very considerable error will arise. It is easy to see how large this error may be when we know that the glasses could only in the most advantageous cases be placed as far as 300 feet apart, and that the minimum distance from the target that it is likely that they will commence to be used is 3,000 yards; the altitude is here thirty times the base. In addition to this, I understand that the device in several cases proved to be unable to withstand the concussion of the great gun fire. Under the circumstances it is natural that their use should have been largely abandoned, and instead, the secondary battery used. With the great rapidity of fire of this, it was easy to take a large rapid fire gun, load with common shell, estimate the distance by eye, run up the sights for that, and fire. If a hit was made, that was the range; if not, the shell would be seen as it struck the water, the sights readjusted accordingly, and the gun having been reloaded in the meantime, another shot taken. It was rarely necessary to make more than two or three trials of this kind before the range was had to a nicety, and then the main battery could be opened up. But let us return to our subject of the instruments.

They had another feature that contributed to their lack of success, which was the difficulty of locating any derangement that might arise. The men were used only to mechanical devices, and a fault that could neither be seen nor detected by the ear seemed to them most mysterious outside of the fact that the testing, even when understood, was none too simple and was rendered still more difficult by the surrounding conditions. As a consequence, but few troubles made them disgusted, and the instruments got the reputation of being far worse than they were.

There is one other class of electric device that can be said to fall in this first class, in that it employs currents of small strength. This is the electric firing arrangement that was used on some of the rapid fire guns. But few of the ships were fitted with this; the "Nashville" was one, and although we had on the whole the most satisfactory results from it, two or three of the others had, I understand, some trouble from miss fires.

This, however, was undoubtedly due to the low battery power furnished to set off the primers, there being a little case holding three small sized dry cells secured to the gun mounts which were supposed to give all that was required. They did as a rule, but dry batteries are not any too reliable anyway, and standing exposed in a metal case to the intense rays of the sun day in and day out did not tend to help matters any. A more powerful type of cell would undoubtedly render them perfectly certain in their action, and as the breech plugs fitted for electric firing are far more simple mechanically than the other types, there is little doubt but that they will be permanently retained.

Leaving now our first general class, we come to class number two. This includes all appliances requiring considerable amounts of current for their operation and takes in the incandescent lamps, the searchlights and the motors.

It may appear strange that special stress should be laid here to the incandescent lamp, as its advantages seem obvious; but it is of extreme value in many ways that are not so apparent at first glance. If we take the easy control of all the lights from a central point, for instance, here alone is a point of the greatest importance. On a regular man-of-war all of the lights that are out of sight and those necessary for the operation of the guns at night, which are fitted with shields to obscure them, are grouped on a common "battle circuit," so that under war conditions all of the other circuit switches may be opened at sundown with the perfect assurance that after that there will be no glimmer of light to betray the vessel's position. On the auxiliary vessels that we had there was no such provision, with the consequence that in spite of the vigilance of the officers they were bound to be found sooner or later with an unauthorized light going somewhere.

It was easy then to see them at quite a distance, and an enemy's ship would have had a great advantage over them, whether she was chasing or trying to slip by. Another place where the electric light was practically indispensable was for the night signal work.

The regular ships were of course fitted with our standard "Ardois" sets, which consist of a string of five lanterns, each half clear glass and half red. Inside of each were two lamps, either of which could be lit independently, and, by means of a keyboard, the different combinations that formed the signals made. These were always ready, and it was but a second's work to flash the private signal at any craft that was deemed suspicious before betraying your own position too markedly by turning on the searchlight or going further and opening fire. The other ships had to have a number of ordinary lanterns ready lit concealed from observation which they would bend on a pair of signal halliards and hoist when they had a communication to make; an opera-

*Read before the New York Electrical Society, Nov. 14, 1898.

ation requiring considerable time. That this time element was important is illustrated by an incident which came under my observation while on the Havana blockade in the early part of the war. There the captain of one of our auxiliary vessels fired on another one of them one night, fortunately discovering his error before any harm was done, and explained his action the next morning by stating that he only saw the other craft when she was very close to him and thought that she was something trying to get in; that there was "no time for signals where he had all that lantern business to go through, so he fired first and asked questions afterward."

We now come to the second device in our class 2, the searchlight. The value of this was proven beyond all possibility of doubt in this war; not only was it valuable, but I think we can go much further and say that if it had not been for it there is a strong probability that the war would not even yet be over.

We learned afterward that at Santiago, leaving aside the practical certainty of night attacks from the harbor of the enemy's torpedo boats, which would have stood an excellent chance of success, Cervera had fully determined to make a night dash to escape. This was rendered an impossibility by the searchlight beams that were kept on the harbor entrance the night through, which made the place as light as day for the ships that were behind the lights and simply dazzled the eyes of any attempting to get out, rendering the navigation of the tortuous channel exceedingly hazardous, and making shooting practically impossible for them. In consequence he found it on the whole better to make his trial in daylight, with the well-known result. If a night run had been feasible owing to the lack of the searchlight, there is a strong probability that the majority at least of the Spanish ships would have gotten away clear, and if they had succeeded in making Havana their dislodgment and capture of the town would have been a problem of a far different and more difficult nature. An illustration of the power of the searchlight may be of interest. Of course for the purpose of "picking up" an object they are of litle use beyond a distance of two or perhaps three miles, but the light is visible at far greater ranges.

I have more than once when off Havana seen on the clouds the reflection of the searchlight that was mounted on the fort at Key West, a distance of over eighty miles, and not only that, but was able to follow the course of the beam as it swung from side to side.

Anticipating a query to that effect I will say that I do not know of any attempt made to communicate with our vessels by this means.

The last of the power-consuming class, the motors, I have concluded not to enlarge on as you are probably all familiar from reading the papers with their performance. The motors for ammunition hoists, turret training, ventilating, fan driving, and, in some cases, steering gear, gave results so far more satisfactory than any other method of control and operation that their continued use is firmly established. The few failures that occurred were far less in number than those of their steam-driven equivalents, and were even then in most cases traceable more to the lack of familiarity of the men with their apparatus than to any inherent defects of the apparatus. It is needless to go into this any further.

As a result of the foregoing, I think we may fairly conclude that in general the devices that are included in class No. 1 are as at present installed of questionable utility, but that class 2 was an unqualified success and a monument to the engineering ability of our electrical profession.

The Mid-European Motor-Car Club of Berlin is taking active steps to organize an international motor-car exhibition to be held in that city next year. A meeting was held in Berlin recently when a special exhibition committee was elected.

ELECTRICAL TRANSMISSION OF POWER IN MINING.*

The disadvantages attendant upon expensive transport of ore has been to a large extent neutralized by the electrical transmission of power. By using electrically-transmitted power the crushing mills could be placed at the mine, and the serious expense of transporting the ore to the site of the water-power could thus be saved. Generally, electricity furnished the only practicable means for transmitting power for mining operations, and the ease with which a copper wire could be carried over any kind of country, together with the plastic nature of the material, rendered the electrical conductor the simplest and most reliable of all vehicles for power transmission. Before deciding whether power transmission should be adopted, it was generally necessary to compare the cost of the alternative methods of (*a*) bringing fuel to a mine to work the machinery by steam, and (*b*) transmitting power electrically to a mine from a generating station situated at some convenient position for utilizing existing water power. The working expenses, added to the interest on the capital invested, made up in both cases the annual cost; but the question as to which alternative should be adopted depended largely upon the hours of working. For working 12 hours a day a result in favor of steam might be shown, while for a 24 hours' day the evidence might be largely in favor of water, depending upon the capital required to be expended in the hydraulic works.

The plant erected at the Sheba Gold Mining Company's mine for the electrical transmission of power to the crushing mills, five miles distant, was described, and the cost of milling was shown to be 1s. 8d. per ton of ore as against 6s. 1d. per ton when aerial ropeway transport was used, and £1 12s. 6d. per ton during the time of ox-wagon transport. The water power was obtained by a dam across the Queen's River, two miles above the generating station, to which the water was conveyed partly in open race and partly in tunnel. The maximum head derived was 32 ft. The turbines were of the Victor horizontal type, driving a countershaft at 300 revolutions per minute by ropes, and were together capable of developing 396 HP. They were provided with Snow governors, acting directly upon the turbine gate.

The generating plant consisted of three alternating-current dynamos supplying current at 3,300 volts. Each generated two alternating currents having a phase difference of 90 deg., and was capable of giving an output of 150 electrical HP. The armature was stationary, and the field magnets rotated at a speed of 400 revolutions per minute. The stationary high-pressure coils were mounted on laminated iron sectors, which were laid close together in a strong cast-iron cylindrical shell made in halves to form the armature. This was 54 in. in internal diameter by 12 in. wide, and within it the field magnet rotated. Each coil was wound on a former, and had 63 turns of double cotton-covered wire 0.12 in. by 0.09 in. in seven layers. The adjacent layers are carefully insulated by micanite cloth, while the complete coil was boiled in paraffin, and was afterwards heavily covered with impregnated tape to a thickness of $\frac{1}{16}$ in. In addition, during the process of mounting, a trough of fiber was interposed between the coil and the iron core. There were 14 coils on the armature, the seven upper coils being for one phase and the seven lower coils for the other; each therefore contributed about 470 volts to the circuit. The coils were displaced to give the phase-difference by the interposition of idle laminated sectors.

The field magnet was excited by a single coil and consisted of a steel wheel from the rim of which projected two series of poles, N on one side of the coil and S on the other. The poles were expanded on the face, and were curved to form a circle of 16 alternate faces, which were presented to the armature core, with an air-gap of 0.33 in. The exciting coil was wound on a cast-iron drum placed in the middle, between the projecting poles, and was positively driven by a couple of pins screwed into the steel casting. It terminated in a pair of gun-metal rings lying side by side upon, and insulated from, a substantial cast-iron bush, which in turn was keyed upon the shaft. The exciters were ordinary two-pole upright machines. For throwing the alternators into parallel the incoming alternator was plugged on to the synchronizing bars, and when approximate synchronism was indicated by the hot-wire voltmeters it was thrown into the main circuit by closing, through a large choking-coil, a path between the synchronizing bars and the main omnibus bars. The choking-coil prevented a large rush of current, due to difference of phase, between the alternators, though at the same time allowing sufficient current to pass to pull the new machine into step.

The current was transmitted by cables to the mine, and at the receiving house the pressure was reduced to 100 volts for driving motors and lighting the workings. The frequency at which the plant worked was 53.3 per second. The conductors were laid underground, and consisted of concentric cables insulated with impregnated jute covered with lead and armored. There was no fall of potential due to self-induction in the cables, nor had the current in one pair of conductors any inductive effect on the neighboring pair. But when overhead wires were employed, the conductors, being of necessity some distance apart, there was not only a fall of potential due to self induction in the lines, but, unless precautions were taken, the mutual induction of the circuits carrying currents of a quarter-phase displacement tended to produce inductive dissymmetry throughout the system. Every length of cable was tested to a pressure of 10,000 volts before leaving the maker's works. Lightning-guards were fitted at each end of the line, to prevent accidents to the machinery from the effects of the induced charge.

At the receiving-house there were four transformers of 50 kilowatts capacity, two for each phase; these reduced the pressure from 3,000 volts to 100 volts. The use of oil for the transformers had been discarded after the experimental trials. The motors were of the induction type; their construction was fully described, and the author also explained their working under varying conditions, and gave a brief account of the laws which governed their action. The crushing mill at Sheba worked night and day; and in one year, of the possible 365 days of 24 hours each, the pressure had been cut off the conductors for only 4 days 8h. 22 min., which had been chiefly occupied in inspecting the water race, overhauling the belts, ropes, etc., and in executing general repairs to the machinery. The efficiency of the plant from the turbine shafts at the generating station to the motor shafts at the mine might be taken at 70 per cent.

* From the *Electrician*, London. Abstract of paper read before the Institution of Civil Engineers by W. B. Esson.

A Useful Present.

Our thanks are hereby tendered to the Joseph Dixon Crucible Company of Jersey City for a handsome Christmas box containing a large and admirable assortment of the far-famed pencils manufactured by the company. It has been our good fortune to receive annually for a number of years from this company a case of their pencils, and in acknowledging the courtesy it affords us much pleasure to be able to say that the merits of the pencils have kept pace with the years until they have now attained a superiority over other makes that is universally acknowledged. They are graded for all kinds of work and meet all the requirements of a first-class lead pencil.

WIRELESS TELEGRAPHY.

A translation of an article on wireless telegraphy by M. Ducretet, explaining his theory on the subject, has been forwarded to the State Department by W. P. Atweil, commercial agent at Roubaix, and will appear in the Consular Reports. Mr. Atwell says that the experiments spoken of by M. Ducretet are now being carried on at his Paris laboratory. M. Ducretet's article reads in part:

"The starting point was the discovery by Henri Hertz, in 1889, of electric waves analogous to waves of light. A machine invented by him enabled one to perceive the diffusion of electric vibration at a short distance.

"Prof. Popoff, a Russian savant, was on the point of applying this discovery to telegraphy in 1895, when he learned that M. Branly, a Frenchman, had already invented the tube seen in my machine and which is the essential point, as this puts in motion the electric currents, or to use the technical term, the inducting currents.

"M. Branly has not received the proper share of praise for his important invention. In 1890 he had already observed the action of electrical radiation on metal filings, free or agglomerated, placed in an insulator between two conductors forming a circuit made by a battery and a galvanometer. The filings, primitively insulated or of very high electric resistance, become conductors when they are struck by an electric wave. This conductibility is destroyed by a blow, but reasserts itself when the filings are struck by a new wave.

"Experiments have been made in Paris and at Brest, where M. Tissot has successfully communicated with a point 1,800 meters (5,905 feet) distant. I have covered a distance of 4 kilometers (2.48 miles), and the transmission was as clear, even through a fog, as between the Pantheon and my laboratory, rue Claude Bernard. I have reason to believe that still greater distances will be compassed. The chief difficulty will be to find two points at sufficient distance and at the same time high enough not to be hidden from one another.

"In towns posts could be readily established by using windows or towers on high buildings very far apart. The only objection would be that all machines favorably situated would receive the telegrams from one transmitter. This would render telegrams public property unless a secret alphabet were adopted.

"The receiving machine may be utiliz d for other purposes than communicating the current to a telegraphic machine; a row of incandescent lamps can be lighted, for example, or the fuse of a mine touched off. It is merely a question of sufficient force."

"On top of the tall building where M. Ducretet's laboratory is located," writes the consular agent, "is a mast sixty-five feet high, through which a wire passes at the top connected below with an electric conductor, a Ruhmkorff coil and an accumulating battery made after a special plan. The machine is set in motion by pressing a handle. The dispatch arrives as well as if it were connected by a wire between the two points. A bell rings to indicate the transmission of the message, and paper rolls out to receive the words printed by the Morse alphabet. The message is received through a garret window, where a hanging wire communicates with the Morse machine."

Mr. Atwell explains that a smaller transmitter has been constructed which has no mast and no wire running above. A simple wall does not interfere for a space of several hundred meters, but to secure transmission between points at a greater distance there must be no iron walls or shafts between the two points.

Electrical Distribution in Switzerland.

The map showing the distribution of electricity from Les Clus Yverdon system in Switzerland is very interesting to examine, says *Industries and Iron*. There is the very long trunk line which ends at Mont-la-Ville, and the other branch which, starting from the station, goes to L'Aubuson. The power taken from the line by each of the places it passes is marked on the map. There is Champion with 3 kilowatts and Mont-la-Ville 35 kilowatts, and so on.

The force of power is the fall of the river Orbe, a feeder of Lake Neuchatel, a masonry dam being built at the village of Ballaigues. The water is conveyed by a canal for a distance of about two miles to the turbine. The head is 150 ft., the quantity of water 350 cubic feet per second, whilst the output of the station is 1,800 HP. The turbines are of the Picard and Pictet type and the alternators of the Oerlikon. The total length of the primary lines is thirty miles, the voltage is 5,200, which is reduced to 120 at the secondary circuits of the transformers.

Canal Haulage.

We notice in our contemporary, *Cosmos*, says the *Electrical Engineer*, London, that Mr. Galliot, of Dijon, has designed what he calls an electric horse for hauling barges in canals. It is interesting to note the details of the proposed system, because at the end of the article it is compared most favorably with that of Messrs. Thwaites and Cowley. The essential point in the Galliot system is the use of a three-wheel electric vehicle, which is able to absorb about 4 KW. to 6 KW.

This vehicle runs along the canal bank, and is supplied with current from two overhead wires by the side of the towing path. An ordinary towing rope is used between the vehicle and the barge. The author considers that this, in its robust simplicity, is much superior to the Thwaites-Cowley system, but from what we know of the usual condition of canal tow-paths, we are afraid that the vehicle would take almost as much power to propel itself as to pull the barge. Another system is described in the same article, in which a rudder propeller is used on the barge itself. In this case the canal banks are likely to suffer from the backwash set up.

SOCIETY NEWS.

American Institute of Electrical Engineers.

The 129th meeting of the Institute will be held at 12 West 31st street, New York, at 8 o'clock on Wednesday evening, December 28.

A lecture will be delivered by Mr. Arthur A. Hamerschlag on the "Education of Electrical Apprentices and Journeymen." It will be illustrated by lantern slides, but no advance copies will be printed.

Applications received from the following candidates for associate membership will be acted upon by the Executive Committee at its meeting, January 25, 1899:

J. Manley Simpson, St. Paul, Minn.
Royal B. Dagget. Chicago, Ill.
George H. Hill, New York.
Ernest R. Hill, Pittsburg, Pa.
Ernest J. Dyer, Yokohama, Japan.
Wm. A. Lynn, Berkeley, Cal.
Thomas P. Thompson, Brooklyn, N. Y.
Robert M. Wilson, Montreal.
Alfred J. Thompson, Havana, Cuba.

A meeting of Executive Committee will be held at 26 Cortlandt street at 4 P. M. December 28.

Chicago Electrical Association.

At the regular meeting of the Chicago Electrical Association, on December 16, Mr. Arthur Vaughan Abbott, chief engineer of the Chicago Telephone Company, delivered a lecture on "Wireless Telegraphy." His practical demonstrations with working apparatus were enthusiastically received by the large audience. Mr. Abbott has been experimenting and developing his apparatus during the past year and now has established communication between his office and residence, which is two miles distant. In the lecture the principles underlying wireless telegraphy were fully explained, with due credit given to Hertz and other pioneers and later investigators as Marconi.

After the lecture the annual election of officers was held with the following result: President, Thomas G. Grier; vice-president, J. M. Hollister; treasurer, Harold Almert; secretary, Cloyd Marshall; directors: F. S. Hickok, E. W. Jewell and Hayward Cochrane.

Northwestern Electrical Association.

Mr. Thomas R. Mercein, secretary and treasurer of the above Association, has sent us a circular letter in which the announcement is made that the seventh Annual Convention of the Association will be held at Hotel Pfister, Milwaukee, Wis., commencing on Wednesday morning, January 18th, next. The following papers will be read and discussed: "Trend of Central Station Design," by B. J. Arnold, Chicago; "Meter-Rate Systems," by E. L. Debell, Sheboygan, Wis.; "Design of Secondary Circuits in Alternating Plants," by George L. Thayer, Belle Plaine, Iowa; "Electricity Direct from Coal," by Prof. A. J. Rogers, Milwaukee; "Inductive Loads on Alternating Current Transformers," by Prof. D. C. Jackson, Wisconsin University; "Electric Vehicles and Their Relation to Central Stations," by H. M. Maxim, Hartford, Conn.; "Association Management," by H. L. Doherty, Madison, Wis. Mr. Frank L. Perry, Chicago, has kindly consented to give his new and successful illustrated lecture on "Curious Things Electrical," in connection with musical and electrical Indian-club exercises and novel pyrotechnic effects by Mr. George W. Patterson, Chicago.

Mr. Mercein states that he has secured the usual one and one-third fare from the Western Passenger Association, conditioned upon 100 certificates of attendance, which plan was successful last January. Buy railroad ticket one way and get certificate from selling agent. It will be unjust to others to use mileage-books or round trip tickets. The railroad joint agent will be in attendance at the convention all Thursday, January 19th, to countersign certificates. Mr. James Wolff, 320 Dearborn St., Chicago, with Mr. W. W. Low and Mr. George S. Whyte, of that city, will have charge of transportation arrangements for delegates coming from or through Chicago.

The Hotel Pfister makes the usual reduced rates to delegates. Rooms and exhibit space should be secured well in advance. Apply direct to the hotel management therefor, and to Mr. Jacob Cloos, Cawker Building, Milwaukee, for current or wiring needed for exhibits. A banquet, theater parties, sleigh rides, etc., are being arranged for, and enjoyable entertainment for all is assured. It is expected that the coming convention will be the largest and most interesting that the Association has ever held.

Exports of Electrical Material from New York.

The following are the exports of electrical material from the port of New York for the week ending December 24:

Antwerp—15 cases, $1,281.
Australia—683 packages, $12,446.
Berlin—3 packages, $606.
Brazil—131 cases, $2,941.
British West Indies—2 cases, $114.
China—1 case, $35.
Chili—54 cases, $1,059.
Christiana—34 cases, $3,815.
Dutch West Indies—4 cases, $62.
Havre—28 packages, $800; 7 cases, $400.
Hull—3 cases, $363.
Japan—21 cases, $683.
London—236 packages, $9,596.
Longesand—1 case, $28.
Newfoundland—3 cases, $56.
Newcastle—11 cases, $1,400.
Rotterdam—2 cases, $216.
Santo Domingo—9 cases, $153; 1 package, $27.
Southampton—12 cases, $639.
St. Petersburg—4 cases, $336.
Venezuela—19 cases, $216.
Vienna—68 packages, $200.
West Hartlepool—10 packages, $1,060,

LEGAL NOTES.

A jury in the Supreme Court in Brooklyn, N. Y., brought in a verdict on Friday for the defendant in the suit of Herman Schienauer against the Brooklyn Heights road for $10,000 damages for personal injuries in a trolley accident. The Court set a new precedent in such cases by awarding to the defendant, the railway company, in addition to the usual costs, an extra allowance of $500 on account of the difficulty and expense of defending the action.

The Supreme Court of Indiana on the 16th inst. decided that the franchise of the Citizens' Street Railroad Company of Indianapolis expires in 1901, and that the franchise granted by the city to the City Street Railway Company is valid. The effect of this decision, if it shall be sustained, will be to put the City company in immediate possession of certain streets not now occupied by the Citizens' company, and to give the former corporation the right to lay tracks in all the streets now occupied by the Citizens' company on the termination of the latter's franchise in 1901. "It is unfortunate," says the Indianapolis *News*, "that this extremely important decision was made by a divided court. Three judges—Howard, Hackney and McCabe—concurred in the prevailing opinion, while two judges—Monks and Jordan—dissented. It so happens that the case was decided by three judges who are about to retire from the bench. Thus there is no assurance that the decision will stand. If a petition for rehearing is filed, as we suppose it will be, the two judges that now dissent will be likely to consider it favorably. And no one can guess what view the three new judges will take."

A peculiar suit, which was noticed in ELECTRICITY several months ago, was decided in the City Court at Savannah, Ga., on the 17th inst. Twelve years ago the Brush Electric Light Company of Savannah bought in all of its outstanding stock. A new company being formed, the main Brush Company of Cleveland, O., agreed to deliver all of this stock. All but fifty shares were delivered, and a guarantee bond was given for these. Recently these fifty shares were sent to Savannah for the collection of interest, which, with the principal, amounted to about $20,000. The Savannah Brush Company sued for the stock, which was in the possession of George T. Hanchett, of New Jersey, claiming title. Hanchett claimed he had received it for a consideration. It was established that it was transferred to him by his uncle, M. E. Avery, of Cleveland, O., who got it from the parent Brush Company for services rendered. On the ground that it had thus been illegally detained, the jury brought in a verdict in favor of the plaintiff, and the Brush Company at Savannah will get the stock.

In the matter of the insolvency of the Union Traction Company of Bergen County, N. J., Vice-Chancellor Pitney on the 18th inst. rendered a decision in which it is held that the claims of the General Electric Company, which supplied the motors to the trolley company, and the Crocker-Wheeler Company, which supplied the dynamos, should be liens on the property and must be satisfied.

A bill in equity was filed on the 20th inst. in the U. S. Circuit Court at Pittsburg, Pa., by the Thomson-Houston Electric Company of Philadelphia and the General Electric Automobile Company against the Johnson Company and the Steel Motor Company for infringement of patents on certain improvements in switches for electric motors.

Judge Cohen of the Supreme Court has granted an order discharging Arthur Ingraham as receiver of the Electric Railway Company, of No. 1 Broadway, New York. He was appointed receiver in January, 1897. The assets realized $3,914 and the debts proved amount to $29,141.

The Ontario High Court of Justice at Toronto, Can., on the 20th inst., gave judgment against the Government in the suit involving the charter of the Canadian Cataract Company, of which W. Rankine and F. L. Stetson of New York, and Albert D. Shaw of Watertown, N. Y., are members. The Government contended that the company forfeited their charter rights by failing to develop 25,000 HP. at the works and to have ready for use and transmission 10,000 horse power by the 1st of November last, which was one of the conditions specified. The company pointed out that no forfeit or penalty had been mentioned in the agreement for the failure to have the work so far completed by November 1, and based its whole defense on that contention. It won on this technicality.

THE NEWS.

What is Going On in the Electrical World.

LIGHTING.

Alexandria Bay, N. Y.—At a public meeting held here on the 15th inst., it was voted to request the village board to ascertain, as nearly as possible, the cost of an electric light plant, water works and sewerage system, with a view of calling a special election to vote an appropriation to procure them.

Belding, Mich.—The council of this place offers a franchise for electric lighting to any responsible person or company that will agree to put in a plant.

Cleveland, N. Y.—The electric light plant which furnished power and light for the United Glass Company's plant was totally destroyed by fire on the night of the 18th inst. The loss is estimated at $3,000.

Cloquet, Minn.—F. McCormack of Duluth has asked the council for the right to establish an electric lighting plant in this village.

Eau Claire, Wis.—It is announced that the Chippewa Valley Electric Railway Company, which owns the Eau Claire and Chippewa Falls lines and the Interurban, has decided to put in a large power plant. It will bid for the contract for city lighting. The company now uses power furnished by the Eau Claire Light & Power Company.

Green Bay, Wis.—The city council has entered into a contract with the Green Bay Gas & Electric Light Company to furnish light for seven years from May 1, 1899. The contract provides that the city may purchase the plant at any time, the value to be fixed by three experts.

Houston, Tex.—It is rumored that the Houston & Texas Central Railroad Company is figuring on establishing an independent electric light plant in this city for the lighting of its entire yards, offices and buildings. The engineers of the company have been given the necessary instructions in regard to the enterprise and in accordance therewith are now preparing plans and specifications.

Jeffersonville, Ind.—City Attorney Voight has rendered an opinion that the ten-year contract with the Electric Light Company is invalid. This will leave the city at liberty to make a new contract at much lower figures.

Milton, Iowa.—On January 4 the citizens of Milton will vote on the proposition of Keosauqua parties to establish an electric lighting system. The officers of Keosauqua company are: President, S. E Irish; secretary, P. S. Miller; treasurer, S. W. Manning.

Muncie, Ind.—The power house of the electric street light plant, owned by the city, was damaged $3,000 by explosion on the morning of the 16th inst., and Superintendent William Warner will probably lose his life. Mr. Warner was lighting the natural gas fire under a boiler that had not been in use for some time. When the torch was applied there was a terrific explosion caused it is supposed by the accumulation of natural gas under the boiler. The superintendent caught the full force of the explosion and was hurled a great distance through a closed door. The flesh on his hands, arms and face was fairly cooked, and he is internally injured by having inhaled the flames.

Pemberton, N. J.—A contract has been awarded to Walter Sexton to light the borough of Pemberton with electricity.

Provo, Utah.—L. L. Nunn of the Telluride Power & Transmission Company has offered to furnish all apparatus to reduce the current from the main line which belongs to his company to a voltage such as the city can use for lighting at a cost to the city of $1,500, the city to provide a house for said plant, transformer or reducer. All apparatus thus furnished he will take back at the expiration of the contract, if so desired, and refund $1,000, the gross proceeds from the sale of lights to be equally divided, the city bearing all expenses of looking after its line, etc.

Sea Isle City, N. J.—City Clerk Chapman has been instructed by the council to advertise for bids for the lighting of the town with arc and incandescent lights.

Sherman, N. Y.—J. L. Thayer, C. H. Corbett, W. A. Edmunds, T. J. Newell, F. L. Cornish, C. E. Cobb and G. D. Marsh have been elected directors of a company which proposes to erect an electric light plant in Sherman. The authorized stock of the company is $5,000.

Spartanburg, S. C.—Julius L. Carson and others are forming a company here for the purpose of erecting a plant to furnish electric lights and power.

St. Paul, Minn.—Alderman Krauft, having investigated street lighting very thoroughly, says that he has figures to prove that electric lighting, even at $115.50 a lamp per annum, is cheaper than gas or gasoline lighting.

Vineland, N. J.—The citizens' committee has prepared a petition to be signed by property holders, asking the borough council to bond the town in the sum of $140,000 for electric lights, waterworks and other improvements.

Waukegan, Ill.—Mr. Force Bain, the Chicago electrical expert, has made estimates and drawings for an electric lighting system to be established here on the recommendation of the special committee on electric lighting.

West Salem, Wis.—Dr. E. C. Swarthout of La Crosse has entered into a contract with the village authorities to light the streets with sixty 32 CP. incandescent lamps.

STREET RAILWAYS.

Bloomsburg, Pa.—A company composed of New York and local capitalists has been organized for the purpose of pushing the street railway project. The company will take up the franchise granted by the council about a year ago to the defunct Bloomsburg Company. It is the intention of those interested to begin the construction of a line between this city and Berwick at once, and later construct a line southward to Sunbury.

Dayton, O.—It is announced that an important deal is nearing consummation for the consolidation of a number of interurban electric lines including those now in operation and others in progress of construction. The reputed deal includes the Piqua & Troy line, the Dayton & Troy line, preparations for the construction of which have all been completed, and the line which has been established and is in operation between this city and Cincinnati. Such a consolidation would create one of the longest interurban systems in the world, and it is not improbable that others will be drawn into the deal. E. H. McKnight, who is interested in electrical properties in Bowling Green, Troy and Middletown, and who purchased a controlling interest in the Troy-Piqua line recently, says the lines will be equipped with the latest improvements.

Fostoria, O.—The deal with the City Light & Heat Company for the city belt lines has been consummated. Philadelphia parties are interested, and will also acquire the lines of the Northwestern Ohio Natural Gas Company and the property and franchises of the Fostoria Light & Power Company.

Gloucester Court House, Va.—The board of supervisors has voted a subscription of $30,000 to the Richmond & Tidewater Railroad Company if their road is built from Richmond to Gloucester Point. The plan is to build an electric line to carry both freight and passengers, and eventually to extend the line on to Mathews county. At Gloucester Point is deep water, and doubtless an important port would be built up there.

Green Bay, Wis.—It is announced that the Fox River Street Railway will be sold at public auction on the 14th day of January. The order fixing this as the date of the sale has been signed by Judge Hastings.

Greenwich, N. Y.—The company which is to construct the electric railway from Schuylerville to Greenwich has purchased from the National Bank of Greenwich the extensive water power at Middle Falls on the Battenkill. The price paid is understood to have been $10,000. Indications would seem to point to a speedy completion of the road.

Hackensack, N. J.—Senator William Johnson, receiver of the Union Traction Company, has been ordered by the Court of Chancery to sell the roadbed, cars, fixtures, buildings and everything else belonging to that company in Hudson and Bergen counties. The railroad is in operation from North Arlington to Woodridge, a distance of eight miles. The company has secured a right of way as far north as Hackensack, but owing to the demand of this town for $50,000 for right of way, which the company could not pay, it went into a receiver's hands. The Metropolitan Trust Company is the complainant in the foreclosure suit. The date fixed for the sale is January 27.

Hartford, Conn.—A petition to the General Assembly has been filed with the Secretary of State for a charter for the Fairfield & Southport Electric & Water Company. Thomas C. Perkins of Hartford, Jeremiah M. Sheehan of Newburg, and Howard K. Knapp of Bridgeport are incorporators.

Leavenworth, Kan.—A. A. Fenn has been granted a franchise by the board of county commissioners to build an electric railroad from this city to Kansas City, Mo. The road will run along the Leavenworth and Kansas City road to Chelsea park, thence through Kansas City, Kan., and connect with the Metropolitan street car line. This is the third project of the kind to be proposed in the last two years, but Mr. Fenn, it is believed, will push the road through. Freight will be hauled as well as passengers.

New Castle, Ind.—The commissioners of Henry County have granted a franchise to the New Castle Electric Railway Company, consisting of E. B. Phillips, R. Wisehart, Thad. Gordon, D. P. Jennings, Dr. J. F. Thompson and T. B. Millikan. The franchise requires work to begin before October, 1899, and one of the proposed lines finished within six months from that time. Several lines are under contemplation within the county.

Philadelphia.—The Interurban Company has decided to build a trolley road running through Delaware,

Chester and Lancaster counties. The road as planned will run from Philadelphia to Lancaster by way of Willistown Inn, West Chester, Unionville and Quarrytown, to Lancaster, taking in all the small places en route. A branch will connect Oxford and West Chester. The officials of the new company are: President and general manager, Winslow Mason; vice-president, John A. Heaney; secretary, M. E. Gibson; treasurer, Henry C. Hiles; chief engineer, W. T. Forsythe; directors: Thomas Bromley, H. W. Lambirth, S. M. Hess, J. Preston Thomas, Dr. G. Morris Philips, S. W. Smith, M. E. Gibson, C. T. Shields, William Garrett, A. F. Johnson, Charles O. Beaumont, M. S. Way, I. G. Le Fevre, W. Mason and W. M. Franklin.

St. Louis.—Work is about to begin on an important electric railway line connecting St. Louis with the town of Fenton, St. Louis County. The road is to be built by the Fenton & Southwestern Railway Company. The line will be 28 miles long, and run through one of the most prosperous portions of St. Louis County, touching some of the largest fruit and vegetable farms in the State.

Terre Haute, Ind.—An electric street railway line is proposed from Terre Haute west through the cities of Paris, Kansas, Charleston and Mattoon, a distance of fifty-eight miles. Crawford Fairbanks, of Terre Haute, is one of the principal capitalists interested in the proposed line, and with him are associated W. R. Patton, W. J. Kenny and A. J. Fryor of Charleston, and John Hamilton, Joseph Montague and H. S. Clark of Mattoon.

West Chester, Pa.—George F. P. Wanzer is at the head of a company which has just been granted a charter for a proposed electric railway from Pottstown to Phoenixville.

MANUFACTURING, ETC.

New York.—Hon. B. D. Woodward, Assistant Commissioner General of the United States to the Paris Exposition, states that the 218,000 square feet of space already allotted for exhibits from the United States have been taken up, and that demands for space are so many that almost twice the amount could be utilized. In the machinery and electricity groups alone America's request for space already aggregates 300,000 square feet.

Pittsburg, Pa.—Contracts have been let for an extension of the plant of the Westinghouse Electric & Manufacturing Company at East Pittsburg which will require an outlay of about $200,000.

Quincy, Ill.—The Quincy Coal Company has made arrangements to work its mines by electrical machinery and light them by electricity.

Washington, D. C.—The District Appropriation bill carries with it the sum of $60,000 for existing electric arc lighting, necessary inspection, and extension of present lines. The arc lights are to cost not more than 25 cents per night, are to be lighted from fifteen minutes after sunset to 45 minutes before sunrise, and are to be operated wholly by underground wires. For electricians, etc., for telegraph and telephone service the sum of $11,520 is asked; and a similar sum is asked for the purchase of general supplies, including new batteries, poles, tools, insulators, etc.; $6,000 is asked for the purpose of placing wires of fire-alarm telegraph and police telephone service underground in existing conduits.

POWER AND TRANSMISSION PLANTS.

Indianapolis, Ind.—A large power house is now being designed for John H. Murphey, which is intended for small manufacturing concerns that require power and light in limited space. The building will be 90 by 250 feet and will be five stories high, and the cost will be from $40,000 to $45,000. The structure will supply adequate quarters for a large number of small manufacturing concerns.

Pittsburg, Pa.—The Miller Electric Construction Company of this city claim to have a new plan to utilize the power of Niagara Falls, and expect to begin work at the falls in a few weeks. The plan will necessitate the expenditure of about $500,000. It is proposed to erect a large building close to the falls, it being kept in place by anchors and heavy iron cables. With a series of contrivances it is expected to utilize all the force of the falling water. Electrical fluid is to be transported by conduits and heavy wire to distant points.

COMPANY MATTERS.

Akron, O.—The board of appraisers has filed the value of the Akron Street Railway & Illuminating Company on the order of the United States Court. The total valuation is $932,689 63, including $500,000 for franchises. The road is bonded for $1,000,000, and has a floating indebtedness of over $100,000 more. It is expected an order of sale will be issued early in January, when a reorganized company will bid it in. General Sam. Thomas will, it is said, be at head of the new company, which will be capitalized at $2 000,000. The road has been in the hands of a receiver for the past eighteen months, but with its twenty-four miles of track is a paying concern.

Baltimore, Md.—The charter of the Wenstrom Electric Light Company has been sold, but the identity of the purchasers cannot be ascertained. It was learned, however, that the price paid for the charter was $10,000 and that it is the intention of those who have acquired it to form a company to engage in the electric lighting business.—It is understood that the control of the Wenstrom Electric Light Company has been secured by Thomas J. Hayward of the firm of Bartlett, Hayward & Co.

PERSONAL AND MISCELLANEA.

Dwight L Clough, the electrician who was recently reported to have survived a shock from an electric current of 11,000 volts received at the power house of the Buffalo & Lockport Railway, is so far recovered as to be able to tell how it feels to be struck by a strong current of electricity. When a reporter of the Buffalo "News" questioned him in regard to the shock, he said: "Well, in the first place, the report given out that a current of 11,000 volts passed through my body was erroneous. The correct measure of the current was 1,000 amperes under a pressure of between 800 and 900 volts. You see the ampere is the measure of volume while the volt is the measure of pressure. With this correction, however, it remains a fact that the chance of living after such a current goes through one is about one in 100. As to my sensations, I had none. I was filing a brush ring on one of the converters. I stood on a rubber mat to insulate myself, as the machine was running. Unnoticed by me, the mat slipped about, and in changing my position a little, I slipped with one foot into the well under the machine. That threw me against the machine and my foot came in contact with the machine frame, completing the circuit. I saw a blinding flash which seemed to play about my wrists. There was an explosion. I was lifted from the floor an instant and then was hurled back. I was conscious all the time and knew what had happened, but I felt nothing. Apparently every nerve and function of my body except the brain was for the moment paralyzed. I lay for a few moments and then managed to get to my feet and attempted to get to the door, but I seemed unable to control my movements and fell again, this time losing consciousness. The next I knew was when I regained my senses for a time in my room in the hotel." Mr. Clough is badly burned about the hands, arms and ankles.

Dr. Wellington Adams died in St. Louis on the 20th inst. from pneumonia. Dr. Adams was born in Brooklyn, N. Y., and was well known as an electrician and inventor. He believed himself the inventor of the present method of mounting a motor on a single axle in the construction of electric street-cars, and brought suit to establish his claim, but failed. The proposed Chicago-St. Louis electric railway, much talked of at one time, was projected by him. His wife, who was constantly by his bedside during his illness, said to a reporter a day or two before his death: "The doctor in his delirium talks constantly of electricity and of the briefs on a patent case in which he is the attorney. Such an active mind! How pitiful that he should be laid low after the brave struggle he has made against adversity. His time, his heart, his money were devoted to establishing his rights to the patent—on electric power applied to the axle direct—the electric motor—in which contest he fought the electric interests of the country. He lost and the strain has been too great. Worried over his defeat and with his system run down in the recent cold spell he easily caught pneumonia."

Kansas City, Mo., has a street car line that can defy the world to find its equal. It is a modern street railway in every particular, but it is only two blocks in length. One of the strangest features of the line is that it does not run straight, notwithstanding its extremely short length. This miniature road is fitted with the most up-to-date equipment, and is operated precisely in the same manner as any other road. The road is so short that the time occupied in traveling from one terminal to the other is less than one minute. The line is not operated merely to retain the franchise, as might be imagined, but it caters to the accommodation of passengers, just as do roads of greater length, and a great many passengers ride on it during a day. The one car used on the line is a large electric car, equipped with powerful double motors, and is fitted with a stove and all other furnishings common to street cars.

RECENT COMPANY ELECTIONS.

Edison Electric Company, York City, Pa.—President G. P. Yost; vice-president, C. A. Eisenhart; secretary, A. F. Geesey; treasurer, C. C. Frick; directors: the three officers first named and H. S. Wiest, Edward T. Moul, B. S. Gilbert and W. F. B. Stewart.

Fairmount Park Transportation Company, Philadelphia.—President, Charles A. Porter; secretary and treasurer, Ellsworth H. Hults; directors: Charles A. Porter, Robert H. Foederer, Dr. J. H. W. Chestnut, Frederick S Dickson, Dr. L. S. Filbert, Bernard Corr and John B. Peddle.

Irwin Electric Light & Power Company, Irwin, Pa—President, Dr. Charles E. Taylor; secretary and treasurer, J. L. Ridinger; directors: the officers and Edward McGrew, C. F. Bilheimer and A. N. Humphreys.

Pueblo Electric Street Railway Company, Pueblo, Col.—President, M D. Thatcher; general manager, J. F. Vail; vice-president and treasurer, A. McClelland; secretary, J. O. Albert; directors: the officers and C. K. Gast, T. H. Devine, H. C. Levis of Schenectady, N. Y., J. S. Bartlett of Boston, Mass., and Francis Fraser of Denver.

COMMERCIAL PARAGRAPHS.

The Wagner Electric Manufacturing Co. of St. Louis Awarded a Contract for the Largest Transformers in the World.

The Wagner Electric Manufacturing Company of St. Louis, through its manager of sales, Mr. E. H. Abadie, has secured the largest transformer order ever placed in this country. The magnitude of the order itself is not the only surprising condition, but further than this the capacity of the units is 800 horse power larger than any other transformers installed in this country to date. The contract in detail was placed by the Union Carbide Company, for its carbide works at Niagara Falls, N. Y., for seven static transformers of 2 00) horse power output capacity each, and two static transformers of 500 horse power output capacity each, complete with switchboards for operating them.

The transformers are to be of the oil-filled type, with water coils for lowering the temperature of the oil. The contract was closed on definite specifications as to iron and copper losses—full, ¾, ½, ¼, and 1 10 load efficiency, guaranteed as to temperature rise, also as to insulation testing, and guarantees made as to 50 per cent. overload in current. As the electrical apparatus installed by the Union Carbide Company is subject to the approval of the great Niagara Falls Power Company, and as Mr. Stilwell, the managing director, has given his approval of the specifications agreed upon, it will be seen that the Wagner Company is recognized as capable of undertaking and successfully completing any installation that seems feasible in the minds of its engineers, and is to be congratulated on its success in this connection.

By securing this order, the Wagner Company has established a record as builder of the largest power transmission transformers in the world, which, combined with its 40,000 volt High Tension Transformers now operating in Provo, Utah, and Telluride, Colo., places the company in the van as leading the world in the building of the largest single unit transformers, and for the highest voltage, a pre-eminence it has attained in the short period of nine years.

The company we understand is getting some very large orders in high potential transmission transformers, where the units range from 100 to 500 horse power and the high tension voltage as high as 40,000 volts.

The Electric Appliance Company of Chicago are calling particular attention to the Jenkins Switch, which is the latest arrival in the field of snap switches. The Electric Appliance Company claim that they are in a position to sell these switches at a much lower figure than has ever been offered before on a first class article. They solicit an opportunity to quote prices to all users of snap switches.

Considerable has been written lately about an old sign in possession of the Western Society of Engineers at Chicago. The words "Harper's Ferry," painted in black, stand out as boldly as when they were first formed by the artist's brush, while the wood around the letters, which was painted with white paint, has worn away about one-sixteenth of an inch. It is asserted by the writers that no paint manufactured nowadays is equal in durability to that which was applied on the old sign.

Mr. William Hooper, of Ticonderoga, N. Y., does not see anything specially remarkable in the preservation of the old sign and claims that there is just as good a paint made nowadays as then. He adds: "I have seen signs that have been painted with black paint directly on the clapboard of the building. The lettering was good after the paint on the balance of the building had disappeared, and after this the whole building was painted over, lettering and all, and the lettering obliterated; yet in ten years afterwards the old black lettering appeared again quite freshly to view. I suppose the paint for the lettering was made of linseed oil and lampblack. I believe, however, that finely ground graphite mixed with pure linseed oil will last as long, or longer, than any other paint ever known of or used. I had a large iron casting which lay in my mill yard for over thirty years. It was painted with only one coat. The old casting was broken up and sold for old iron last month, and I noticed that the paint on the pieces of casting, even after being broken up, looked quite fresh.

"If the surface to be painted is perfectly dry when the finely ground graphite is applied, the paint will prove the most lasting paint known, because if time eliminates all of the oil, the graphite seems to adhere to the surface painted just the same as a piece of paper or wood will appear after it has been rubbed with a lead pencil or a piece of graphite. No other pigment known to me will remain on the surface painted after the oil has been thoroughly destroyed. With the experience I have had with graphite paint, I thoroughly believe if any dry surface be covered with graphite paint and left untouched for a period of 30 years—by which time the oil will have disappeared—no doubt a letter could be written plainly on the surface by using a piece of large wire or nail after smoothing the end of the wire or nail which is to be used as a pencil. I have done all this and shown it up to others. Writing with the piece of wire polishes the graphite which adheres to the surface, showing that it is there still."

INCORPORATIONS.

The Electropathic Company, Buffalo, N. Y.—to manufacture electrical apparatus. Capital stock, $1,000. Directors: Alfred C. Sheu, Helen Z. M. Rodgers and Elbert Rodgers, Buffalo.

The Municipal Police Signal Company, Chicago—to manufacture electrical signals. Capital stock, $25,C00. Incorporators: John Mackin, N. Banks Cregier and Henry Shafer.

The Briton Power & Electric Company, Briton, S. D. Capital stock, $3,500. Incorporators: Charles Hamilton, Henry L. Stokes, Eugene A. Cooper, George Thiel and Joseph Barber.

The Hamilton & Eaton Electric Street Railway Company, Hamilton, O. Capital stock, $10,000. Incorporators: J. H. Shallenberger, James A. Walker, J. E. Anderson, C. F. Elliott and J. C. Unzicker.

The William Porter's Son Company, New York—to make fixtures for oil, gas and electric illumination. Capital stock, $100,000, all paid in. Incorporators: Annie M. Porter, W. H. Porter and N. E. Porter.

The Leadville Water Works Company, Leadville, Col.—to acquire the property and franchises of the Leadville Water Company, and to erect plants for the generation of electricity and the compression of air. Capital stock, $400,000. Directors: Henry B. Gleaves, D. B. Wesson, W. E. Hawks, C. N. Priddy and W. W. Mason. Branch offices of the company will be established at Boston, Mass., and Portland, Me.

The Electric Indicator Company, Louisville, Ky.—to manufacture and sell electrial appliances, especially the indicator, upon which letters patent were granted to J. D. Keene and J. J. Roberts. Capital stock, $30,000. Incorporators: J. D. Keene, Ben T. Venderink and C. S. Dodson.

ELECTRICAL PATENT RECORD.

Letters Patent Issued December 20, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

616,120. Railway Switch. Edwin S. Leaycraft, Jersey City, N. J. Filed Feb. 3, 1898.
616,301. Pneumatic Motor for Electric Appliances for Cars. Clarence A. Evans, Upland, Pa. Filed July 13, 1897.
616,403. System of Electric Traction. Michelangelo Cattori, Rome, Italy. Filed Dec. 24, 1897.
616,435 Electrically-Welded Joint. Richard Eyre and William Dishong, Johnstown, Pa., assignors, by mesne assignments, to the Lorain Steel Company of Ohio. Filed Feb. 7, 1898.
616,436, 616,437. Electric Welding. Henry F. A. Kleinschmidt, Johnstown, Pa., assignor, by direct and mesne assignments, to the Lorain Steel Company of Ohio. Filed Feb. 7, 1898.
616,102. Car-Fender. Peter Heesem, Pittsburg, Pa. Filed Feb. 17, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

616,111. Arc-Light Regulator. William J. Kelly, Boston, Mass. Filed Jan. 29, 1896. Renewed June 1, 1898.
616,276. Illuminant for Incandescent Electric Lamps and Process of Making. Orlando M. Thowless, Newark, N. J. Filed Jan. 31, 1896.

ELECTRICAL MACHINERY AND APPARATUS.

616,110. Electric Switch. William J. Kelly, Boston, Mass. Filed May 1, 1897.
616,2 5. Field-Magnet for Electric Machines. Sidney H. Short, Cleveland, O. Filed July 28, 1898.
616,313. Electric Generator for Cycles or Other Vehicles. James Moores and Henry O. Farrel, Manchester, England. Filed May 24, 1898.
616,393. Combined Bearing and Power-Transmitting Device. Carl O. C. Billberg, Lewisburg, and Paul A. N. Winand, Philadelphia, Pa. Filed Nov. 23, 1897.
616,405. Automatic Magnetic Circuit-Breaker. Charles M. Clark, New York City. Filed May 27, 1898.
616,417. Indicator. Frederick Hackmann, Milwaukee, Wis., assignor, by direct and mesne assignments, to the Automatic Indicator Company, same place. Filed Nov. 26, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

616,136. Auxiliary Fire-Alarm-Telegraph Apparatus. Bartholomew Oehmen, New York City, assignor to the Gamewell Fire Alarm Telegraph Company, same place. Filed Jan. 14, 1898.
616,186. Microphone Containing Granular Carbon for Retaining Material in Position. Lars M. Ericsson, Stockholm, Sweden, assignor to the Aktiebolaget L. M. Ericsson & Co., same place. Filed April 6, 1898.
616,222. Telegraph-Repeater. Frederick W. Cole, Newton, Mass. Filed Aug. 5, 1893.

MISCELLANEOUS.

616,070. Machine for Measuring Wire and Indicating Its Weight. James P. Barron, John R. Logan and Martin S. Sheridan, Pittsburg, Pa. Filed Oct. 25, 1897.
616,079. Electrical Burglar-Alarm. Clyde Coleman, Chicago, Ill., assignor, by mesne assignments, of two-thirds to George P. Jones, same place. Filed June 29, 1896.
616,082. Thermostatic Auxiliary Fire-Alarm System. Albert H. Cross, New York City, assignor to the Gamewell Auxiliary Fire Alarm Company, Boston, Mass. Filed June 1, 1898.
616,139. Method of Electrolytically Treating Straw or Other Fibrous Material. Goldsbury H. Pond, Ashburnham, Mass. Filed July 9, 1897.
616,148. Magnetic Switch. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed April 23, 1897.
616,165. Carbon for Electric Welding. George W. de Tunzelmann, London, England. Filed Feb 25, 1898.
616,174. Electric Voting Machine. Frank S. Wood, Boston, Mass. Filed Jan. 16, 1897.
616,190. Electric Operation of Elevators by Three-Button Push-Systems. John D. Ihlder, Yonkers, N. Y., assignor to the Otis Brothers & Company, New York City. Filed Dec. 16, 1897.
616,339. Ammeter for Alternating Electric Currents. Waldo A. Layman, St. Louis, Mo. Filed April 4, 1898.
616,358. Electrically-Operated Regulator for Dampers, etc. George F. Richardson, Hartford, Conn. Filed April 15, 1898.

TELEPHONE AND TELEGRAPH.

A bill has been introduced in the U. S. Senate providing a penalty for any failure of the Chesapeake & Potomac Telephone Company to lower its rates as provided by law. The bill recites that not more than $50 per annum shall be charged for a telephone placed in a hotel, store or office or other place of business in the District, and not more than $36 per annum for residences, unlimited service to be furnished in each case. Failure to comply with this law will incur a fine of $500 for each offence. It is further provided that if the Chesapeake & Potomac Telephone Company does not notify the District Commissioners within thirty days from the passage of the act that they will comply with these requirements they are to be prohibited from the use of the streets and avenues of the city for their conduits, and the Commissioners are to dispose of the privilege of operating a telephone service in the District of Columbia to the highest bidder.

Mayor Quincy of Boston has signed the bill granting the Massachusetts Telephone & Telegraph Company the right to construct lines and furnish telephone service in Boston. The company, according to the provisions of the bill, must begin construction by July 1 next and have its lines in operation in two years. The Massachusetts company is associated with the Boston and New York Telephone & Telegraph Company which was incorporated at Trenton, N. J., on the 16th inst., with a stated capital of $1,000,000. The men prominently interested in both of the companies are Zephaniah S. Holbrook, of Cambridge, Mass., who will probably be the president; Oakes Ames, Milton, Mass.; Frederick A. Spear and Charles E. Adams, Lowell, and J. Stewart Rusk, Boston.

The Columbia Telephone Company, of Columbia, Pa., has completed its line to Mt. Joy, where it has secured a large number of subscribers. The lines of the company will soon be extended to Elizabethtown and thence to Lebanon where a local company has been organized. An extension will be also made from Mountville along the pike to connect with the independent company now building a line from Lancaster toward Columbia. The York Telephone Company's line has been erected to within a few miles of Wrightsville. When it reaches the latter place connection will be made with the Columbia company. With York and Lancaster connected by a local company the monopolists will soon see their finish.

It is stated in the St. Louis *Chronicle* that General Manager H. J. Hanford of the Kinloch Telephone Company has just issued the fourth bulletin of the Kinloch telephone system, containing 2,219 names, an increase of 572 over the last issue. Manager Hanford says that the complete directory of the 4,600 telephones now in place in St. Louis will be issued in the early part of January. There are 1,000 other contracts for telephones which the company will soon take up. The company will endeavor to put up and connect 500 'phones a week until the entire system is complete.

Stephen P. Stone, Daniel H. Stone and Charles H. Stone, of Beaver, Pa., and H. C. Patterson, H. H. Patterson and James P. Stone, of Beaver Falls, are the incorporators of the Pennsylvania Telegraph & Telephone Company. It is the intention of the company to consolidate the independent lines operating in New Castle, Youngstown, Butler, Erie and down the Ohio river as far as Wheeling, including Hookstown, East Liverpool, Wellsville and Steubenville.

A conference of the business men of Peoria, Ill., with the Central Union Telephone Company, in regard to a reduction of rates, resulted in a change of schedule lowering the charges on all classes of service from 10 to 35 per cent. The prompt action of the company is attributed to the fact that an independent telephone company has a franchise for the installation of a plant in Peoria, although no work has yet been done, and it is thought that the reduction was made in the hope of scaring the new company out.

The amended sections of the ordinance approved March 31, 1896, by the Philadelphia councils granting permission to the Standard Telephone & Telegraph Company to construct and operate a system of electric wires, conductors and cables through and under the streets of the city, came before the select council at a special meeting held on the 23d inst., and was passed by a vote of 27 yeas to 8 nays. The amendments to the original ordinance are principally such as give the company a longer time in which to get their system into operation, and also permit the placing of wires over and across streets.

A correspondent of the Macon, Ga., *Telegraph*, writing from Lizella, Ga., says: "The Macon & Birmingham Railway has no telegraph line, and as yet no telephone system has been brought into this neighborhood. This would be a fine location for a telephone system connecting us with Macon, and through Macon with the rest of the State. Will not some of the capitalists who read the *Telegraph* take note of this and investigate the opportunity here for profits in this line?"

Congressman Corliss of Michigan has introduced a bill in the House of Representatives providing for a Government cable from some point on the Pacific coast of the United States to Hawaii, the Philippines and Japan. The bill proposes to secure an appropriation from the Treasury to build and equip a cable which would be used for commercial and other messages at rates to be established by the Postmaster-General, who will have charge of it.

The Bell Telephone Company has been endeavoring for some time to get the control of the Western Indiana and the Jasper County telephone companies, which control a large number of exchanges and many miles of toll lines, but at a meeting held at Lafayette, Ind., on the 20th, the Bell proposition was rejected and a 25-year contract was entered into by the above companies with the Lafayette Independent Telephone Company and the new long-distance telephone company of Indianapolis.

The Kansas City, Mo., *Times* of the 20th inst. states that the Standard Telephone Company is now building through Kansas City and will open an office there in a few days. E. Peterson will be the manager. The company has now about 1,000 miles of line and reaches most of the prominent towns in central Missouri. The company expects to reach St. Louis with its lines in about sixty days.

The Perry Electric Company of Peoria, Ill., which is to introduce the automatic telephones in that city has secured its incorporation papers at Springfield. The capital stock is $2,500. The incorporators are Nathaniel V. Perry, Ralph E. Seymour and Dwight R. Chapman of Peoria.

The American District Telegraph Company of Ohio has been incorporated at Columbus with a capital of $50,000, to conduct a messenger service with call boxes and all necessary adjuncts. The company intends to operate throughout the State of Ohio.

The long talked of telephonic communication between the two Russian capitals—Moscow and St. Petersburg—is likely to become an accomplished fact before the end of the year. It will prove an inestimable boon to business men, as telegraph messages require ten or twelve hours for transmission.

Owing to certain alleged irregularities in the ordinance granting the use of the streets and alleys of the borough of Homestead, Pa., to the Homestead Telephone Company, the council of that borough threatens to revoke the franchise recently given the company.

Wm. N. Turner, and Emma B. Turner, his wife, have been granted a telephone franchise by the Common Council of North Vernon, Ind. Long distance connection will be made. Business houses will be charged $1.50 and residences $1.00 per month.

E. H. Rolston, manager of the Hanover telephone system, was at Hopkins, Mo., a few days ago preparing to put in a system which will be owned by a local company. It is expected that a system of seventy-five 'phones will be in operation at Hopkins in a few weeks.

The United Telegraph, Telephone & Electric Company of Chicago has certified to an increase in the number of its directors from five to nine.

At Monroe, N. C., W. S. Lee, J. M. Belk and R. A. Morrow are organizing a company to establish a telephone system.

New Companies Incorporated.

The Columbia & Northern Telephone & Telegraph Company, Colville, Wash. Capital stock, $15,000.

The Pennsylvania Telegraph & Telephone Company, Beaver Falls, Pa. Capital stock, $50,000.

The Youngblood-Stampers Telephone Company, Benton, Ill.—Capital stock, $12,000. Incorporators: R. A. Youngblood, F. H. Stampers and N. H. Youngblood.

The Lexington Telephone Company, Lexington, Tenn.—to operate telephones. Authorized capital, $200,000. Incorporators: J. E. Mcleall, H. E. Gruner, E. J. Timberlake, O. G. Gathing and W. T. Watson.

The Columbus Citizens' Telephone Company, Columbus, O.—to operate a local telephone system. Authorized capital, $500,000. Incorporators: H. D. Critchfield, E. R. Sharp, J. B. Hanna, J. B. Hoge, F. A. Davis, W. A. Hardesty and H. A. Landman.

The Putnam County Telephone Company, Green Castle, Ind.—to operate a plant and line in Putnam and contiguous counties. Capital stock, $10,000. Directors: F. C. Gilmore, C. C. Hart and Jesse Richardson.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 12.65@12.75c.; Lake, 12.75@13c.; casting, 12.65@12.75c.

The Electrozone Commercial Company of Philadelphia will, it is stated, erect a plant at Atlantic City with a capacity of 10,000 gallons a day.

The American Bell Telephone Company has declared its regular quarterly dividend of 3 per cent. and an extra dividend of 1½ per cent., payable January 16. Books close January 2 and reopen January 14.

The Boston Electric Light Company has declared a quarterly dividend of $1.50 per share, payable January 14 to stock of record December 31, 1898. Transfer books will be closed from December 31 to January 14.

The Thirteenth & Fifteenth Streets Passenger Railway Company Philadelphia, has authorized the distribution of six months' rental under lease to the Philadelphia Traction Company, being $5.50 per share, payable January 3.

The City Passenger Railway Company of Baltimore has declared its regular quarterly semi-annual dividend of 5 per cent. The Consolidated Company of Baltimore declared 2½ per cent. dividend for the half year, an increase of ½ per cent., and places the stock on a 5 per cent. basis.

By a recent transaction the first mortgage bondholders of the Saratoga (N. Y.) Traction Company have come into possession of a majority of the stock and the bondholders and stockholders are now virtually the same parties. It is their intention to extend the road to Ballston Spa, and have it in operation by next July.

The Kings County Electric Light & Power Company gives notice to stockholders of the Edison Electric Illuminating Company of Brooklyn that the Central Trust Company will be ready December 28 to issue temporary certificates calling for the 6 per cent. 99-year gold bonds which are to be issued in exchange for the Edison stock deposited.

The New York Rapid Transit Commissioners have prepared a new bill to submit to the Legislature, one section of which will give it the right to dispose of surplus electricity as heat, light and power, not only along the route of the proposed underground road, but also into all parts of the city which can be conveniently reached by subways leading into the tunnel.

A. J. Elias, Henry Hart and other heavy shareholders in the Third Avenue Railroad, New York, have purchased the Fifth Avenue stage line, the last remaining relic of omnibus transportation in this city. It is understood that the line will be equipped with electric stages, the Third Avenue people having considered this a favorable method of using their surplus electricity.

The Philadelphia "Stockholder" says it is understood that negotiations are in progress looking to the establishment of a considerable plant and a reorganization of the management of the American Railway Electric Light Company. The additional intimation is current that a consolidation of all the railway lighting concerns in the country is probable in the near future.

The Brooklyn "Eagle" publishes the report that there is to be a readjustment of the securities of the Brooklyn City Railroad shortly after the first of the year by converting its stock and bonds into 4 per cent. bonds. There are $12,000,000 of the stock of the Brooklyn City Railroad upon which dividends of $1,200,000 are annually distributed. In round figures there are $7,000,000 of bonds on which the interest at the rate of 5 per cent. per annum amounts to $350,000 or a total of $1,550,000 annually. To convert these into 4 per cent. bonds would require an issue of $38,750,000.

The "Railroad Gazette" publishes in its last number some figures of the cost of operating street railroads in New York and Chicago, from a paper read at Stevens Institute by Arthur J. Wood. While the electric conduit roads are operated in New York at a cost of 10.23 cents a car mile, in Chicago the cost of trolley roads is 13.051 cents. The cable roads in New York cost 16.35 cents a car mile to run, while in Chicago the cost is only 10.706 cents. In Connecticut nineteen trolley roads, each of which carries more than 1,000,000 passengers a year, show an average working cost per car mile of 13.83 cents.

The Philadelphia "Inquirer" of the 24th inst. says: "A corporation with a capital of $25,000,000 is in process of organization, and will shortly apply for a charter under the laws of New Jersey, which has for its object the combination of the electric light companies in Camden, Atlantic City and other points in New Jersey, and also places in Delaware, Montgomery and Chester counties in Pennsylvania. Philadelphia capitalists will be largely interested in the company, and negotiations are now being made with companies in the places where it is proposed to do business, with the view to securing the lighting privileges. There will be 500,000 shares of the new company's stock, par value $50. It is denied that 100,000 of these shares will go as a bonus to the stockholders of the Pennsylvania Manufacturing, Light & Power Company."

The following order has been sent by the Secretary of War to the commanding officers in Cuba, Porto Rico and the Philippines: "Until otherwise ordered, no grant or concessions of public or corporate rights or franchises for the construction of public or quasi-public works, such as railroads, tramways, telegraph and telephone lines, waterworks, gas works, electric light lines, etc., shall be made by any municipal or other local governmental authority or body in Cuba, Porto Rico or the Philippines, except upon approval of the Major General commanding the military forces of the United States in Cuba, Porto Rico or the Philippines, who shall before approving any such grant or concession be specially authorized by the Secretary of War."

The following appears as a New York item in the Boston "News Bureau" of the 22d inst.: "We learn upon undoubted authority that the New York Gas, Electric Light, Heat & Power Company has secured control of the Edison Electric Illuminating Company of New York. The former company is controlled by the Whitney syndicate in the interest of the Metropolitan Street Railway and will use its surplus electric power. The stock of the Edison Company will be taken in on a basis of about 210 in exchange for a 4 per cent. bond. The issue of bonds has been underwritten and will be offered to the public within the next fortnight. The subscription price has not been determined but will not be under par. This insures something more than 8 per cent. on the Edison stock."

Mr. E. E. Higgins, editor of the "Street Railway Journal," in a recent interview with a representative of the New York "Commercial," gave the following interesting information in regard to the operations of the principal street railway companies, showing a gratifying increase in the general business. He says: "In 1897 the gross results were but 1 9 per cent. more than in 1896, which improvement was materially less than that of 1896 over 1895. In 1898, however, the improvement has again become decided, as is shown by the following figures: In New York City the Metropolitan Street Railway Company shows 24.8 per cent. gain in the last nine months of the year, in Brooklyn the Brooklyn Rapid Transit system shows 12 8 per cent. gain, and the Nassau system 14 2, while the elevated lines in that city have to record a loss. In Albany the gain is 8 6 per cent., in Syracuse 5 9 per cent., in Providence 2 8 per cent., in Boston (North Shore Traction Company) 3.6 per cent., in the shoe manufacturing city of Brookline 1.3 per cent., in Baltimore (Consolidated system) 1 6 per cent., in Scranton 6.1 per cent., in Cleveland (Cleveland Electric) 5.1 per cent., in Columbus 12 8 per cent., in Detroit (Detroit Citizens') 8.4 per cent., in Chicago (North Chicago) 3.9 per cent., in Minneapolis (St. Paul) 8 per cent., in New Orleans (New Orleans Traction) 5.6 per cent., in Kansas City 1.07 per cent., and in Denver 4 per cent."

EDITORIAL NOTES.

American Methods and Electrical Apparatus Abroad.

The British manufacturer would seem to be gradually awakening to the fact that during the last decade this country has been making very rapid strides in the manufacture and use of electrical machinery and distancing Great Britain, which, with its proverbial conservatism, was slow to adopt electricity as a motive power. Strenuous efforts are now apparently being made by men of high standing in England to spur on the manufacturers of electrical apparatus in that country with a view to cutting down if possible the lead this country has of them. It is naturally exceedingly aggravating, and goes against the average Englishman's pride, to be obliged to purchase yearly a large amount of electrical apparatus from us, and even be obliged in some cases to send over here for electrical engineers and skilled laborers.

Mr. E. V. Knox, a member of the British Parliament, in a recent communication to the London *Mail*, stated that during the past ten years the people of the United States, by a liberal policy pursued towards street railway companies in granting them franchises over streets, had created an industry almost as great as Great Britain's trade with China, which the British have been building up little by little for the last forty years. Among other things in the communication referred to, Mr. Knox stated that in the last few years 12,000 miles of electric street railways had been constructed in the United States at a cost, including equipment, of $300,000,000.

The mileage given is, however, not strictly accurate, as this country at the present time has approximately 14,000 miles of electric street railways. Mr. Knox regretted that America had gotten this great start in electricity, which he recognized as the inevitable motive power of the next century, because, as he explains it, by this start is meant that similar industries developed abroad will be apt to be developed by American ingenuity and in many instances by American capital. Mr. Knox further points to the fact, apparently with regret, that the equipment of the Waterloo & City and Central London lines is all coming from America. When electric street cars were introduced at Leeds, the center of the locomotive district, all the motors were imported from the United States. A case is cited where American workmen had to be brought over to complete an electric street car line in Dublin.

But England is by no means the only country in Europe that is obliged to purchase American electrical apparatus and employ American labor, even if our exports of electrical machinery are far greater to the United Kingdom than to any other country abroad. Even Germany, which prides itself on its up-to-date electrical developments, and whose ambition is to eclipse with its electrical exhibits those from the United States at the Paris Exposition of 1900, purchased from this country during the last fiscal year $240,577 worth of electrical machinery, consisting principally of street railway equipments. Furthermore, General Porter, on his return from Europe some time ago, stated that he was constantly meeting in the different countries he visited, engineers in charge of electrical undertakings who were either Americans by birth or who had been trained on this side of the Atlantic.

Long Distance Independent Telephone Service.

In the question of long distance telephony the New York Telephone Company would seem to have a decided advantage over the People's Telephone Company which is earnestly seeking to gain a foothold in this vicinity. Many firms in New York City would undoubtedly be only too glad to patronize the new company and have the Bell instrument removed were it not for the fact that the Bell system enables them to reach points where no independent companies exist. That this unsatisfactory state of affairs will ultimately be remedied cannot be doubted, as new independent companies are constantly starting up all over the country.

Only recently a new company known as the Massachusetts Telephone & Telegraph Company was organized, with several million dollars capital, to compete with the Bell company in Boston, while independent telephone organizations may be found in Detroit, St. Louis and Indianapolis. That independent telephone companies are gaining a foothold all over the country may be gathered from the following statement of Mr. J. E. Keelyn which recently appeared in a New York daily:

"There is now competition by means of exchanges independent of the Bell in all the towns of importance between New York and Washington, excepting New Brunswick and Philadelphia. Work is under way on independent exchanges in all the cities between New York and Boston, and including Boston. If a foothold could be got in New York City the Bell company would be forced, first to reduce rates, second to furnish 'phones free, and third to go out of business.

"Let me tell you the experience in New Jersey. There are independent exchanges in Jersey City, Newark, Paterson, Passaic, Elizabeth, Bound Brook and Trenton. Further south there are inde-

pendent exchanges in Chester, West Chester and Coatesville, Pa., and in Wilmington, Del. But I will speak of New Jersey first.

"In Elizabeth the Bell company when the independent exchange was started had 225 telephones. It has 300 now, and the independent company has 400. Before competition came the Bell company charged $100. The new company charged $35 for business and $25 for residences. The Bell fell to $21 for business and $18 for residences, but it is actually furnishing telephones free to persons who have ordered them out. The Bell is practically driven out of Elizabeth.

"In Newark the Bell company had 2,400 telephones, and charged $120 a year. A new company was started but made the mistake of putting in too cheap a plant. The plant has been rebuilt, and 2,000 telephones are in operation, while arrangements are being made for 2,000 more. The new company charges $48 for an unlimited service, and the Bell came down to $40. Soon the Bell will have nothing of real value in Newark but its long distance connection.

"The independent exchanges in Paterson and Passaic will soon be connected with Newark. There are 650 independent telephones in operation in Jersey City and 1,000 in Trenton.

"Chester, Pa., furnishes a good example of what can be done. Chester is a suburb of Philadelphia. The Bell company has 225 telephones, and charged $80 per year. After one year the new company has 600 telephones in operation, charging $30 for business and $20 for residences, has paid dividends regularly, and its stock is twenty-five per cent. above par. The Bell company is giving service away in Chester."

Mr. Keelyn further states that at the present time there are as many as 3,000 independent telephone exchanges in the United States. Such being the case it can readily be seen that as soon as independent companies succeed in gaining a foothold in the principal cities, such as New York, Boston and Philadelphia, arrangements could be made for long distance independent service equally as good as that now furnished by the Bell monopoly and at probably one-half the price now asked.

Seeking to Expand Our Export Trade.

We are in receipt of a memorial gotten up by the Merchants' Association of New York, addressed to the President of the United States, the Vice-President, members of the Cabinet, and to the members of both Houses, urging the passage of a bill, No. 2,524, entitled "A bill to increase the efficiency of the Foreign Service of the United States, and to provide for the Reorganization of the Consular Service."

There is probably no more important question before the electrical fraternity of the United States than that of the expansion of our exports in electrical goods and the ways and means of accomplishing it. The proper solution of this question is not only worthy of, but requires, the most thorough and exacting study. The search for foreign markets for our goods may be said to have developed in late years to an exact specialized science, in which not only individual exporters and associations, but expert Government commissions, elaborately organized, equipped and maintained, lend their efforts to the expansion of our export trade.

The fact seems to have been conclusively proved that markets for our goods can only be obtained and retained through an intelligent study of the wants of the various markets of the world, an absolute willingness to cater to those wants, and the expenditure of necessary capital and energy sufficient to make that willingness known. The Consuls can give information about markets, the nature of the goods required, and can encourage foreign trade in many ways, and it is with a view to making our Consular Service more efficient in this respect that the Merchants' Association of New York is striving by advocating the bill now pending in Congress, which in the memorial just distributed is referred to as follows:

"We have believed for some time that, properly to expand our export trade of manufactured products, it is necessary that the Consular Service of the country be placed upon a better footing than that upon which it stands now.

"The bill in question, while a radical one, we think provides the change by which the Consular Service of this country can be made to do for this country in the export of manufactured products what the Consular Service of Great Britain and Germany does for those two nations, and that it will do more to place properly before the consumers of the world at large, through the accredited channels of the Government, the superiority of American manufactured products than any other means that can be adopted."

This measure, as we understand it, contemplates the removal of the Consular Service of this country from politics, the appointments being made, after a suitable Civil Service examination, for life, subject of course to good behavior and efficiency. Positions left vacant through death or otherwise would be filled by promotion, or in other words, the system would be very similar to that now in vogue in Great Britain and Germany, which has done so much to stimulate the export trade of those countries. The changing of our Consuls by every incoming Administration cannot but work harm to the export interests of this country, as a Consul no sooner becomes familiar with the requirements of the locality to which he has been assigned than a new Consul is appointed who has to spend considerable time familiarizing himself with the new conditions. That the Consular Service of the United States is even now doing good work is not to be doubted. As every one knows, one of the most valuable offices which our Consuls perform is to gather information abroad as to the methods in vogue in conducting business and also in giving advice as to how we may extend our markets. They are watchful to discover any openings for the introduction of American manufactures, and it is unquestionably largely due to their efforts that American manufactures have attracted so much attention in foreign markets. Their reports to the Bureau of Foreign Commerce of the State Department are replete with suggestions that are of the greatest value to our manufacturers who are struggling with the export problem.

The bill which the Merchants' Association is so strongly advocating, providing it becomes a law cannot help but still further improve our Consular Service, and for that reason it should receive the support of all those interested in the export question. Although valuable suggestions are constantly being received from our foreign Consuls, one trouble is that they are not always heeded, and that manufacturers seeking a market for their goods give as a rule very little thought to the needs of the people they desire to do business with. So long as American manufacturers persist in sending what suits them, instead of what their customers desire, they will fail to build up anything like a profitable foreign trade, in spite of any improvement in Consular service.

A BRIDGE of 900 feet span at Budapest is being erected entirely by means of electrical machinery. The iron girders used as piles to keep the water back from the excavations for the shore pillars were driven in by an electric ram. The ram was a hammer rising 34 feet, with a velocity of 12 feet per second. The soil out of the holes was raised by an electric windlass. The water was removed by seven centrifugal pumps working day and night. The five-inch diameter pumps were driven by 10 horse-power motors, the eight-inch by 16 horse-power, and one nine-inch by a 20 horse-power motor.

Under the Searchlight.

Notes and Comments on Various Topics.

CUBA was Uncle Sam's New Year's gift, and we wish him joy of it. It adds something to the tug on his trowser straps, but his shoulders are broad and his gallowses strong, and no one need fear that the additional load will destroy the symmetry of his figure or diminish the sweetness of his grin. As shown in the picture papers nowadays the old man looks as if he had been rejuvenating himself by a course of electric baths.

MAYOR CHASE, the only Socialist elected by an Eastern municipality to the headship of a city government, was inaugurated at Haverhill, Mass., on Monday. The Mayor advocates in his inaugural address the municipal ownership of electric lighting plants and street railways—of course.

* * *

EXPERIMENTS of an interesting nature have been made with a new explosive, liquid air, and with encouraging results, under the conditions of trial. This is reported as having been the case with tests made on the parade ground at Munich, and an exhaustive test on a large scale is reported as having taken place in a coal mine at Pensburg, not far from Munich, trials which, continued for months, proved very satisfactory. The chief advantage claimed for this explosive is its slight cost, being simply that of the power used in liquefying the air. Even the fact that after a short time the substance ceases to be capable of exploding is urged as a recommendation in one respect, for, if a detonator hangs fire, there is no danger of the charge going off accidentally some time after the explosion is due.

* * *

ELECTRICITY has in the past unquestionably been responsible either directly or indirectly for many deaths, but a death recently occurred due to the drinking of the "fluid" from an electric battery, which is probably the first case of the kind on record.

* * *

THE Prince of Monaco has been known since 1885 as an enthusiastic student of the sea and its various forms of life. One afternoon, while in the Bay of Biscay, he sank the trap in which he collected specimens. It went to the bottom in over 12,000 feet of water, and as night approached he fastened to the wire attached to it an electric buoy and then stood off a mile or so. As he and his fourteen sailors were watching with a good deal of satisfaction the swaying buoy with its brilliant illumination a steamer's lights came into view. It was soon evident that the steamer was curious to know the meaning of the illumination, for she altered her course and made for the light. Up she came to within a quarter of a mile of the buoy, slowed up for a minute, and then started ahead, perhaps a little disgusted at the incident that had lured her several miles out of her course. She had hardly got away when a second steamer came into view, and she too bore down upon the lighted buoy. The sailors on the Prince's vessel understood by this time that the illumination was probably believed to be evidence of a disaster. Just as the Prince's steamer was moving up to explain matters she was nearly run down by one of the large liners in the Oriental trade, which had also left her course to render what assistance she could.

The incident proved of value, for thereafter the Prince carefully refrained from exhibiting his electric buoy on any of the much traveled ocean routes.

WHAT is termed an over and under ground street railway system has recently been patented. With this system it is claimed that the difficulties experienced in running cars during the winter, when the tracks are covered with snow, will be overcome. The inventors employ a large conduit, in which the tracks are laid, while the body of the car runs above ground. The trucks will run on the underground track, and a support will extend from each track, through a slot, to the bottom of the car. The cost of excavating for a system of this description in a city like New York would in all probability prohibit its ever being adopted.

ONE thing the Cuban ruralist must learn, says the *Telegraph Age*, is not to cut down telegraph wires when he wishes to bale his hay. The custom is not strictly up to date.

Proposals Invited by the Government.

The Bureau of Yards and Docks of the U. S. Navy Department is inviting sealed proposals until January 14, 1899, for extending the electric light system at the New York Navy Yard. Specifications, blank forms of proposals, and a general plan will be forwarded to intending bidders upon application to the Bureau or to the Commandant of the yard. Bidders are expected to inform themselves of the character of the work by visiting the Navy Yard.

The War Department, through the U. S. Engineer at Norfolk, Va., is inviting sealed proposals until January 24, 1899, for furnishing and setting up four storage batteries at Fort Monroe, Va. Information will be furnished upon application to Major Thos. L. Casey, 166 Granby street, Norfolk, Va.

RONALD T. McDONALD'S DEATH AND BUSINESS INTERESTS.

(*From the New Orleans Picayune, December 25.*)

The news of the death of Mr. R. T. McDonald was a shocking surprise to his many friends and acquaintances in this city. He had been in New Orleans within the past fortnight, and left here in apparently perfect health on the 14th inst. It was known here that he was taken sick shortly after he reached Dallas, whither he went to meet his private secretary and superintendent, W. H. McGrath, of the ice and electric light plant in that city, in which corporation he was largely interested.

He was robust, and might have been considered a fine specimen of manhood. His friends here apprehend that it was over-confidence in his vigorous constitution which caused him to disregard the danger of that insidious malady, and thus was finally developed the attack which proved fatal while so far away from his home and family. He went to Dallas alone and had expressed his intention of returning here without delay. Attention might be called to the coincidence of the sale of the municipal ice plant of this city, in which he was a large stockholder, having been consummated the very morning of his death, the sad intelligence being received here within an hour or so after the sale had been made.

A SUCCESSFUL PROMOTER.

He was regarded as one of the most successful promoters of public interests throughout the country. He first became identified with interests in the Crescent City in 1885, by becoming interested in the Louisiana Electric Light & Power Company, through the Ft. Wayne, Ind., Electric Light & Power Company. Associated then with Mr. Maurice J. Hart, he extended his interests into the traction, sewerage, ice and other corporations. Through business misunderstandings he and Mr. Hart became estranged, which resulted in some rather sensational litigation, the outcome of which was the recent decision of Judge King, of the civil district court of this parish, with judgment in favor of the Harts in the sum of $11,000, which judgment is now on appeal before the Supreme Court.

Mr. McDonald was born in Allegheny, Pa., June 24, 1849, and went to Fort Wayne in 1860. During the war he served in Company C, 152d Indiana Infantry. Returning to Fort Wayne, Mr. McDonald worked as a clerk in a dry goods store, afterwards becoming a member of the firm of Evans, McDonald & Evans, wholesale dry-goods dealers. The firm failed in 1881, and two years later Mr. McDonald established the Fort Wayne Electric Company, which has since become famous. He was a director in two Fort Wayne banks, was at one time a director of the Fort Wayne Consolidated Street Railway, was exclusive owner of the artificial ice plant in that city, owned the new Avenue Hotel, Riverview Stock Farm and innumerable smaller properties. He was the owner of the Broad Ripple Street Railway in Indianapolis, principal owner of the Hoffman House, New York, was interested in the New Orleans artificial ice plants, and had electric light interests in Chicago, Detroit, New York, St. Louis, Brooklyn, Syracuse, N. Y., and other cities.

THE BELL BOY'S FRIEND.

A lifelong friend of the bell boy is gone. Mr. R. T. McDonald was a favorite among all the "fronts" of the hotel where he stopped. The news of his sudden and unexpected death was received with more profound and sincere regret by no one than by the bell boys of the St. Charles Hotel. One by one they passed the word along the line, and when the noon watch went off duty they told the other watch that R. T. McDonald was dead. The boys spoke of little else during the afternoon. His arrival was always the signal for good cheer among the lads who wait upon the bench and answer calls.

WELL KNOWN IN BALTIMORE.

(*From the Baltimore Sun, Dec. 27.*)

Mr. Ronald T. McDonald, president of the Fort Wayne Electric Corporation, who died on Friday at Dallas, Tex., was well known in Baltimore. He came to Baltimore about 1890 and purchased from the receivers the International District Telegraph & Construction Company, which had operated the Heisler system of electric lighting. From this he built up the Maryland Electric Company, which under his direction in five years had an earning capacity of $300,000 a year. Mr. J. Frank Morrison was the representative of Mr. McDonald in Baltimore. About two years ago Boston capitalists bought out Mr. McDonald's interest in the Maryland Electric Company and changed the name to that of the Edison Electric Illuminating Company. Mr. McDonald a few years ago leased the Wenstrom Electric Works at Calverton, and began the manufacture of motors and dynamos. The franchise of the Wenstrom Company was recently sold. Mr. McDonald had two homes, one in New York and the other in Fort Wayne, Ind. He is survived by a widow and a fifteen-year-old daughter.

THE NEW POWER STATION AT SHEFFIELD, ENGLAND.

Of all the work of various kinds that is being carried on at Sheffield preparatory to the change in the system of tramway traction, says the *Surveyor*, the erection of the electric power station on Kelham Island, from which all the power for driving the cars will be obtained, is considered to be the most important. As a center for a power station Kelham Island is said to be admirable. It fulfils the essential conditions of being within a short distance of the lines, so that the current may be conveyed with as little waste as possible, and of providing space for any extensions of buildings that may be required in the future, as the tramway system is gradually enlarged, and lines cover all the principal streets of the city.

The buildings are so contrived that they can at any time be extended by additions to one end. The site of Crowley's Foundry premises which the corporation have bought is very large, and hardly half the land is at present being used for the provision of a station which is calculated to supply power to all the present lines and as many more as will be ready when it is completed. As a matter of fact, by no means the whole of the ground has been cleared and the large portion of the old buildings left standing are being used as temporary stables and stores. The station consists of two large oblong buildings, the largest of which, the engine and dynamo house, occupies about 5,000 square feet, and the smaller, which is for the boilers, about 3,500 square feet. Thirty or forty men have been at work since the beginning of July, and very good progress has been made. The buildings are of brick, plain and neat, substantial and in character with the kind of work for which they will be used. The most tasteful-looking elevation will be that on the south side, where the wall, 40 ft. high, will be pierced by two rows of windows, those in the lower story placed together in pairs, and those higher in groups of three. This will be the wall of the engine-house, the inside measurement of which is 100 ft. by 50 ft.

The heavy foundations have been carried down to a depth of 10 ft. below the ground line, and afford space for six engines. At first only three engines are to be put in. These will be of 300 horse-power, supplied by an American firm, and will be coupled to dynamos having a capacity of 225 kilowatts so arranged that they can be used independently or all worked together. A short time ago it was anticipated that one dynamo would probably prove sufficient to work the traffic, but the corporation seem now disposed to push on the extensions of the lines at a greater speed, and it is not unlikely that additional engines will be required before the house has been long in use. As already explained, however, it will not be necessary to extend the building for the first additions to the stock, as the beds of three more engines are already outlined. When extensions are needed the east end will have to be removed, and it will be possible to go on lengthening the building for a long time before all the land is covered. The same means will be adopted for enlarging the boiler-house, which adjoins the engine-house, standing nearer the river. This is at present 76 ft. long by 40 ft. 6 in. wide, and will hold three boilers, each of 300 horse-power, and fitted with patent induced draught supplied by fans working in the power-house. The boilers will be 10 ft. square at the base.

The brickwork of the engine-house is being filled into a skeleton of steel framework as large as any recently used in Sheffield. Ten upright steel stanchions are fixed, eight of which are 50 ft. high, and the others 10 ft. or 15 ft. lower. Across these are laid steel beams, which will support the roof trestles, and to which can also be fixed a traveling crane, by means of which any portion of the machinery can be removed without unnecessary delay. It was at first intended to have steel framework for the boiler-house as well, but there was a difficulty in obtaining the material, and this part of the design had to be abandoned. As it was, the work was considerably delayed by the slow arrival of the stanchions for the engine-house.

The boiler-house will be lined with salt-glazed bricks, so that the sanitary measure of washing the sides can be taken from time to time, and glazed bricks will line the engine-house. The height of the two buildings from the floor to the eave of the roof will be about 40 ft. Along the roof of each will be a long lantern, which will admit sufficient light. The side of the boiler-house will be lined with coal bunkers some 12 ft. wide, and at one end there will be a tower for the tanks. Lavatories are provided in the building. Such good progress has been made with the work that if there is a continuance of fine weather the building will probably be completed by the end of March.

ELECTRICAL CANAL TRACTION.*

The *Bulletin* of the Association of Electrical Engineers of Liege for May of the current year was entirely devoted to the question of canal traction, mechanical and electrical. While far too lengthy to produce in extenso, or even to abstract at any length, we hope in the following series to be able to give such a resumé of the salient points as will be of use and interest. The canals of England languish in the grip of the railroad interest, but the time must arrive when even a Parliament, packed with selfish railroad directors, must give attention to so vital a question. The author of the paper which appears in the *Bulletin* was Mr. Van der Wallen, who remarked at the outset that canal traction was to-day in a very backward state considering the great development of late of different modes of traction. Everywhere one sees animal haulage, the animal being victorious over the numerous tentative efforts to replace him by mechanical means.

All canals have been built with a view to haulage in some form, and it is to improve on this mechanically and economically that efforts should be made. On rivers and large canals the problem is different. Self-towing and towing are the only practicable means capable of being utilized. Self-towing on a chain is excellent on rapid streams of small depths having at least a slope of 0.30 m. per km. The draught of water augmenting and the slope falling below 25 cm. the tow boat sees its superiority well reduced. On the descent the advantage is always with a tug, for the tow boat is fast to its chain, and if the current is rapid the towed boat may overrun the tug and collide. Towing is understood to be towing upon a sunk chain—as distinct from tugging by means of a free boat. From an economical point of view the fuel expense of towing is only about one third that of tugging, but there is the inconvenience of being fast upon a chain, so that if the traffic is stopped the tow vessel is idle, but a tug has a much wider field and can go anywhere, and moreover, is of less first cost. Some large companies have both paddle and screw tugs. Paddles are suitable in shallow waters, but are costly in construction and work. The company of the Lower Seine and Oise have vessels fitted both for chain towage and tugging. Up stream they are towers, down stream they are free tug boats, and they afford a service at once quick, regular and economical. MM. Molinos and Bovet consider this the best system of traction for canalized rivers.

Compared with the ordinary system of towage, there is less use of the chain, a stoppage of the chief causes of breakage, better utilization of plant, and an increase of the possibilities of traffic, with reduction of expense and the power to run down stream as free tugs.

Compared with tugs, the advantages of the double system are equality at times of low water and an incontestable superiority at times of high water. For such a service to pay, the traffic should be large and the locks also large enough to take a train of barges. A train of four barges, for example, occupies four hours, and a single boat less than 30 minutes, so that a convoy loses 90 minutes at each lock if of one boat capacity. Experience has shown that the mean speed of such a convoy cannot be over 3.6 kms. per hour on a canal which is much used. Similarly, a horse-hauled boat attains nominally 2 km. speed. To regain an hour lost at a lock a convoy would need to travel 6.750 kms. Thus the towage of trains of four boats cannot be carried out except at a disadvantage as regards speed unless the pools between the locks are each 6.750 kms. in length.

It is thus evident that the question of economy depends very much on the distance between, and the size of, the locks. To have a towing vessel, whether on a chain or with screw propulsion and the attendant expense in the shape of fuel, attendance and repairs, there must first be sufficient traffic to supply several barges at one time to be towed. The towing vessel must not tow a single barge, but a train. Now, if the locks are only large enough to pass one vessel at once—which is the case with almost all our English canals—there will be a considerable loss of time at each lock, and if locks succeed one another quickly, the journey speed will be very slow indeed. Clearly there is a good deal of thinking to be done upon each problem. On very busy canals, with pools of suitable length, it would be practicable to maintain the towing vessel always in its own particular pool. It would never pass the locks, but occupy itself in towing barges each way from lock to lock. Where such a system is practicable it would save time at the locks, and would also save a considerable difficulty at the locks in the shape of the management of the tow chain.

Another solution of the question is that of self-propelled barges. Erroneous apparently in principle, because of the idle time of the motive power at times of loading, yet it is capable of successful application for carrying goods necessitating high speed.

The use of gas and oil engines offers the chance of reducing some of the foregoing objections. One instance alone is cited—that of the French company Seine Maritime, which conducts a rapid service between the English Channel, Rouen and Paris by means of flats driven by gas motors. The gas is carried in steel tubes at a pressure of about 100 kgs. per cm^2; these tubes measure 250 mm. diameter, and are 5 m. long and 8 mm. thick to contain 22 m^3 of gas. They weigh 325 kgs. These tubes, to the number of 80, are connected in a battery by flexible joints. The motor is vertical, with two cylinders of 40 HP. total, of the "Simplex" type driving a screw on the Mo-Glasson principle, variable and reversible, which permits any speed from nil to maximum without change of speed of the engine. Two men manage the boat, a driver and a pilot. Such a boat will measure 300 tons, and will be 30 m. long, 5.50 m. beam, and 2.25 m. deep. Trials between Havre and Tancarville show that one minute is enough to set the motor going, and at 180 to 250 revolutions the flat, carrying 145 tons, travels 5½ to 6 knots.

This system appears to be the counterpart of gas tramway traction. It is necessary to have either gas compressing stations or that each vessel should be able to compress its own gas. This would be somewhat impracticable and costly, and gas haulage would seem only to be applicable under special conditions as to the supply of gas at the convenience of a suitable station for its compression, or the presence of a compressed gas main with connections for the boats at several points en route. Strong gas alone can be carried in reasonably small bulk, so that producer gas would be shut out, otherwise gas haulage seems very suitable for canal barge towing. It has one great advantage not possessed by the tramway gas traction, that, the resistance being practically constant, the gas motor may be exactly suited to its one duty—that of haulage at the level. On tramway work the gas engine must be very much larger than its mean power, for it must provide both for rapid acceleration and for the maximum grade. Electricity can do both, because in electrical work the energy comes from outside. In a gas engine the energy is generated by the engine, which must be large enough for its highest duty, and, unlike an electric motor, cannot be overloaded. An electric motor will utilize a heavy current for a few minutes and is at a great advantage in this compared with gas. On canal work, however, these particular advantages lose their value, and in canal haulage we should expect gas to give good results on such systems as were suited for its adoption.

The following are stated as essentials of mechanical canal traction: A power of 3 HP. to 4 HP. effective, capable of being augmented, even at a reduced speed, at the passage of a lock.

The systems at present capable of filling these essentials may be placed under three heads:

(*a*) An endless cable kept in constant motion to which barges may be attached.

(*b*) Machines in place of horses, running the length of the canal.

(*c*) Temporary motors placed on board the boats and easily moved so as to serve any boat, and so be utilized without interruption.

Under the first head comes cable haulage, first proposed in 1862, and now only of historical interest.

The moving cable does not seem to have been a success. One difficulty was the obliquity of the pull on the cables and the difficulty of passing the haulage rope past the carrier pulleys. It was difficult to attach tow ropes to the moving cable, and there was the sudden pull on the rope as soon as attached, and no time was allowed to the boatmen to get aboard again. To enable the tow rope to quit the pulley groove, the flanges of the latter were notched, and when the notch came round it admitted the tow rope and so led it off and out of the groove, the straight running main rope not catching in the notch. We need not further follow the description of this rope system, which is fully described and illustrated in respect of grips and pulleys. The system is not one likely to come into use in face of the possibilities of electric traction. Unlike tramway cable traction, the moving cable in barge haulage cannot receive back any power from boats as does a tramway cable from cars running down hill. Then it is obvious that there must be an enormous loss of power by friction at the numerous pulleys, especially at curves where the rope has a heavy lateral pressure on its carriers.

Under the second head, that of traveling machines, it is remarked that at the outset no success accompanied the system. A trial was made with a locomotive running on the bank of the canal of Neuff-Fosse, between Fontinettes and Douai, on a length of 77 kms. with one lock only. The line was ballasted on a width of 2 meters and a depth of 0.3 m. The rails weighed 15 kgs. per meter, and were laid on cross ties of wood spaced 1 meter apart. The locomotives had four coupled wheels and weighed 14 tons in working order, which seems an excessive weight, but each train consisted of two or three boats, and the speed was 1,500 kms. per hour. The chief cause of the abandonment was the cost of the railway, and the heavy engines required. In 1892, however, electrical traction was tried on the patent of M. Galliot, upon the canal of Bourgogne. The Society Decèfle & Cie., who worked the patent, constructed a kind of electrical tricycle. The overhead trolley system was employed. The cable was fixed behind, between the motor wheels. The motor is bipolar of 6 kw.

The shaft gives motion by a bronze worm to a wheel on the axle of the driving wheels, which are of iron wrapped in aloes fiber for elasticity and grip. The vehicle carries a light cab or shelter in which the driver controls the machine with the necessary levers and foot brake. The whole machine only weighs 2 tons.

A third system is that of Lamb, and consists of electrical motors running on cables and hauling boats as in the previous system. A strong cable is carried on posts on the bank. A carriage runs on this cable carrying a motor which drives a wheel by means of a worm. Round this wheel is once wound a second or traction cable. The haulage rope is attached to the carriage. The two cables are so isolated as to serve for conductors. The worm runs in an oil bath with very little friction. The motor can be driven from deck by means of suitable wires carried on the haulage cable, or there may be a driver seated on a suspended seat from the motor itself.

M. Busser proposed in 1893, at the Chicago Congress, to place a motor in a float attached to the rudder of a barge, and to drive a small screw pro-

* From the *Electrical Review*, London, Dec. 9, 1898.

peller therewith by means of a chain, and a similar proposal was made by M. Galliot at the Congress of the Hague, a screw propeller being driven by a motor through a vertical shaft in the rudder post.

The Bovet system consists of chains laid in the canal itself and simply carried over wheels on the barge, the barge mechanism being electrically actuated from overhead conductors. An ordinary chain is sufficient, and has the advantage that it will slip at times of abnormal stress and so obviate accident. The following formulæ are given for calculating an establishment of this type. Given T the annual tonnage in millions, K the journey of a boat in km., and C the load of a boat. Then 300 C K represents the tonnage per km. The number of boats in circulation per km. will be $n = \frac{10^6 \text{ T}}{300 \text{ C K}}$. Their headway in kms. will be $e = \frac{600 \text{ C K}}{10^6 \text{ T}}$. Thus on a length of 60 kms. the annual traffic being $3\frac{1}{2}$ million tons, and the boats of 200 tons burden, traversing 30 kms. each, if the journey speed be 12 hours the velocity will be 2,500 m. per hour.

Each boat is estimated to require 3.2 kw. of energy or a total of 275 kw., or 535 HP., allowing 91 per cent. output of generator. These values are arrived at from the formula $r = (a + b\,t)\,\text{v}^{2.25}$ where v is the speed in meters per second, and t the draught in meters; r being the resistance in kgs.; a and b being—a 21.3, 21.5, and 14.2, and b 123.6, 78.1, and 52.4 for three classes of boat known in France as the *Peniche*, the *Flute* and the *Toue*. The formula is applicable to speeds of .25 to 2.5 m. per second, and draughts of 0.65 to 1.83 m.

It is advised that for steam power there should be a power station on each section. Gas engines, too, may well be divided up into several stations, and they have an advantage over steam for powers under 25 HP. Oil engines are, unhappily, too costly to run, or they seem best suited to power distribution for canal traction purposes.

Phase currents are not new in industry. Why, it is asked, can they not be used in canal traction? The necessity for three lines need not be a serious disadvantage as is sometimes urged. The polyphase motor is so simple and strong as to demand serious consideration where it will be worked by men little acquainted with electricity. The polyphase system is more elastic and permits of a variation in the haulage as required, whilst on normal duty the speed is steady. Current is taken from the line by means of a two-wheeled carriage with a pendulum counterweight, the grooves of the pulleys being shaped to clear the insulators. The carriage is drawn by the boat by means of the cable which carries the current on board. The return current is not practicable by way of the tow chain. A second wire is therefore provided as return.

The carriage seems better than the fishing rod system, for a barge is not confined by a rigid rail and the arm must be long and very adjustable.

The use of accumulators does not seem to be very practicable for canal haulage. They are referred to as having been applied in England to pleasure vessels on the Thames, E.P.S. batteries of 44 to 180 elements being used according to the size of the boat, and double-bladed screws employed directly driven by four-pole motors excited in series.

A trial was made in France by the Société Boulet et Cie. Fifty-two Gadot cells were employed to work a Gramme motor equal to 100 volts × 41 amperes, with a three-bladed screw at 300 revolutions per minute. Speed trials showed 1 km. in 4 minutes 18 seconds, or a speed of 14 kms. per hour. The battery gave 30 amperes in full discharge. At 80 per cent. efficiency the work performed was 3.25 HP.

The Gymnote, a submarine torpedo boat of the French Admiralty, was tried in 1888 at Toulon. It had a four-bladed screw of 1.50 m. diameter. The motor was of a 16-pole type. The poles were placed on a moving ring of 1 m. diameter, and furnished with a four-brush collector, two for forward and two for backward running. The speed was 250 per minute, and the screw was driven direct. The weight of the motor was 2,000 kgs. It gave 60 HP. with a 200-volt current and 220 amperes. The battery was 564 cells of the liquid alkali type Commelin-Desmazures-Baillache. Each cell weighed 17.5 kgs., or a total of 9,840 kgs. for the whole. With a capacity of 345 HP.-hours, sufficient for about 6 hours' run, this means 28.6 kgs. per horse power of charge. The speed for 6 hours would be 10 knots. Neither of these examples can be rated as commercial, however. For barge work the problem is quite different, and one must consider the question of the cost of loading and unloading the battery for charging, the shocks consequent on this and the damage to the cells, which rapidly deteriorate. It is, of course, easy to charge the batteries in place, given time to do so. This should be done without unduly delaying their work and might be done by night.

Relatively to tramway work canal haulage is much easier for accumulators. The following figures may be studied: A boat of 350 tons will run $4\frac{1}{2}$ to 5 hours at 3 kms. per hour with a battery of a capacity of 110 ampere-hours weighing about 1,000 kgs., and measuring 1.42 m² × 325 mm. high. For a tramcar the battery will have capacity of 180 ampere-hours and will weigh 1,750 kgs., and occupy an area of 2.16 m² of the same height—325 mm.—as the former. It is assumed that the weight of a battery in kgs. is a little over $\frac{1}{500}$th of its capacity in watt-hours. The displacement of a barge is, say, 339 tons, or 0.97 of the nominal 350 m³. At 3 kms. per hour its resistance may be taken as 0.37 kg. per m³ of displacement. The total traction is thus 125 kgs. The work per second is 104 kgm. or 1,020 watts, or say, 1,500 watts furnished to the motor. For a 6 hours' run the weight will be about 750 kgs. on the above rule. The rule is thus derived: Let I be the capacity of the battery, and I_1 its capacity per kgm. of plate. Then $\frac{\text{I}}{\text{I}_1}$ is the weight of plate per element. Add 0.65, then the weight in working order is $1.65\,\frac{\text{I}}{\text{I}_1}$. At the tension E there will be $\frac{\text{E}}{1.97}$ elements, whence the weight in kgs. is $\frac{1.65\,\text{E I}}{1.97\,\text{I}_1}$ for the batteries of the Société Electric. The current available is 15 ampere-hours per kg. of plate, but only two-thirds this is guaranteed. For 10 ampere-hours, therefore, is found by substitution in the above formula 0.0838 E I.

As before stated, there is an electrical system on the canal Bourgogne on a length of 6 kms., of which 3,300 m. are in tunnel. This length is the summit level. It receives large quantities of water daily, at least 30,000 m³ in all seasons, of which 18,000 go to the lock at Pouilly and 12,000 to that at Escommes. At Pouilly there is a fall of 7 m. or 19 HP., and at Escommes one of 8 m. or 15 HP., a total of 34 HP. Being similar, one only, that of Pouilly, need be described. The turbine is of Girard type, 1.16 m. in diameter and 100 revolutions per minute, geared to a shaft at 200 revolutions. It is regulated by a sluice electrically operated. The dynamos are of 11.6 and 9 EHP. of Gramme type. The ordinary work requires 370 volts (280 only at Escommes) or 23 amperes. The generators are in series and shunt wound because the employment of an accumulator was intended. The winding is condemned as causing great sparking, and if wound in series this fault would be absent, but it would be inconvenient for battery charging. Moreover, each machine tends to reverse the other's polarity.

At the time of starting a boat the turbines are only overcoming friction. By too rapid absorption of current at the motors, the turbines are overloaded and run slowly; as the fall at Pouilly is less than at Escommes, the Pouilly dynamo is liable to be reversed in polarity. Frequent at one time, they have been checked by a powerful rheostat of 180 ohms resistance so as to prevent too rapid admission of current to the motors. Slow movement of the rheostat enables the turbines to follow up their increased loading.

The advantage of the arrangement is that three conductors alone are required, one directly between the dynamos and two outer ones across which the motors work. The length of the electrical circuit is constant, and the current thus does not vary as the boat travels. Coupling in parallel would require four lines. Lower voltage is also possible with less line loss. The conductors are of telegraph bronze 8 mm. in diameter and of 45 kgs. per mm² tenacity, and 98 per cent. conductivity. The circuit resistance is 3.9 ohms. When under 600 volts the current is of 20 amperes. The fall of potential is 78 volts and the efficiency output 87 per cent. The conductors are carried by transverse iron carriers from posts. In the tunnel portion they are held by iron staples driven into the crown of the arching. They are hung by stirrups from the insulators. The middle wire simply passes over the throat of the insulators and is secured by brass wire. There is a tendency to sparking at the stirrups which have to be made thin to remedy this fault.

The advantages of the system are rapid erection, non-rigidity, absence of solder, different lengths being coupled by screwed bronze sleeves right and left threaded, the surface of contact secured being considerable, and they serve also to lengthen or tighten the line. Two trolleys are employed on a rod $7\frac{1}{2}$ m. long, of which 4 m. is of iron tube, the rest being bamboo. The pulleys are protected by india-rubber guards against short-circuiting if derailed. The motor is of Gramme type, series wound. At 550 volts and 30 amperes it gives 19 HP. at 900 revolutions. It is belted to the fly-wheel of the gearing, which is so arranged as to give a speed of 20 or 40 to the chain wheel, corresponding to a rate of travel of 0.65 or 1.30 meters per second. The chain runs in the middle line of the barge. The barge is lighted as it passes the tunnel by two series of lamps, arranged so that as the rear lamp is extinguished a fresh one lights up, the length of the barge being thus constantly illuminated. The accumulators contain 250 elements. Their normal capacity is 15 amperes discharge rate and 10 amperes charging. The battery is shunt connected to the line and serves as a steadier, not being required as a store, for there is no lack of water. It is placed at the generating house, though formerly it was on the towing vessel, and caused damage by acid vapors. For a period of six months the cost of transport has been 0.071 franc per ton, or about $\frac{3}{4}$d., showing an economy of 30 per cent. over steam towage at 0.103 franc. The air of the tunnel is, of course, no longer rendered suffocating by the smoke of coal, and the speed obtained is good.

Use of a Voltmeter in Electro Diagnosis.

Richard Cornaz, of Berne, contributes a long article to the Archives d'Electricité Medicale (October 15, 1898), relating an interesting series of experiments made with a view to determine whether the EMF. or intensity of the current necessary to produce muscular contraction was the more reliable as a factor in diagnosis. A combination galvanometer and voltmeter made by Gaiffe, of Paris, was used to determine the number of volts and milliamperes. Experience showed that the records for a minimum contraction usually varied during the same seance and at different seances. It was found also that the voltage varied a good deal less than the intensity, and one interesting case showed what mistakes in diagnosis might arise from trusting to the milliammeter. A patient suffering from traumatic neuritis of the right radial nerve was experimented on. With faradism the same strength of current gave

the minimum contraction whether applied to the right or left ulnar nerve. With galvanism the voltage for a minimum contraction varied in seven tests made at one seance from 5.8 to 7.2 on the right side, and from 6.4 to 7.8 on the left. The milliamperes varied on the right from 0.8 to 1.3, on the left 0.4 to 0.9. Taking the mean and comparing side with side the voltage varied from 6.4 on the right to 7.1 on the left, while the intensity varied from 0.67 on the left to 1.0 on the right.

In another series of experiments the voltage varied from 5.32 on the right to 5.2 on the left and the intensity from 1.35 (right) to 0.524 (left). Here then were two normal ulnar nerves presenting the same faradic excitability, which reacted to about the same voltage, while the intensity varied almost as 1 : 2. But if one divides the voltage by the intensity to get the resistances, one gets the reason for the great variation in the intensity. The maximum resistance on the right side was 4,000, on the left it reached 10,000 ohms. Basing one's opinion on the readings of the milliammeter, one would say that the excitability of the right ulnar nerve is diminished one-half since more than twice the number of milliamperes is required. As a matter of fact the right ulnar is healthy and shows no trace of either motor or sensory paralysis. Over 1,000 tests were made, and in all but one the variations in the voltmeter were much less than in the galvanometer.—*Journal of Electro-Therapeutics.*

NOTES ON THE DISTRIBUTION OF ALTERNATING CURRENTS.*

BY SIDNEY E. T. EWING.

Great diversity of opinion exists among engineers as to the best and most economical methods for the distribution of alternating currents. In a few years' time no doubt as great uniformity will obtain as is now the case in continuous current work, but at the present the variations of opinion and practice are very striking, hardly two stations in the country being alike, save perhaps when they are the work of the same firm throughout, and have not been subjected to the ideas of an independent consultant. The following notes are intended to indicate the apparatus and methods in most general use, with such comment as seems likely to be of service to readers:

General Conditions of Economy.—From the point of view of economy, the general aspect resolves itself into the just proportioning of the interest charges on the capital cost and the cost of generating the units lost in distribution. Naturally many factors enter the question which render the best solution in individual cases very difficult to decide. Two examples exhibiting very different conditions may be cited. The one is a company whose compulsory area is very large and scattered, and whose available capital at the outset was unduly small. In this case the only way open was to put down high-tension distributors in conjunction with house transformers. This was done and enabled a start to be made on a fairly paying load, drawn chiefly from a residential district, and for some years a good dividend has been paid. At the present time, however, the ratio of the number of transformers in circuit to that of consumers is as one to three, and as most of the transformers are of the old make and poor design the magnetizing load (true watts) is nearly 9 per cent. of the maximum load on the station. The other example, offering a very complete contrast, is the undertaking of the corporation of a rather densely populated town about the same size as the above. In this case the consulting engineer, having plenty of capital at his command, arranged for some thirteen well-equipped sub-stations in the central area, and a network of low-tension mains in all the principal and secondary streets of sufficient section to meet any probable demand for several years to come. A number of large transformers were also installed, whose capacity far exceeded the demand after the first 18 months of working. The load taken up during this period being chiefly supplied to early-closing shops and offices—comparatively unremunerative customers—the undertaking has been heavily handicapped by the large interest charges. Thus in the former of these two instances an arrangement of plant which cannot be recommended in the abstract has enabled a profit to be made under circumstances which would have debarred a more efficient, and therefore more expensive, system from doing so; while in the second the adoption of a very efficient and permanent plant has resulted in an immediate loss, where a more modest beginning, with a more elastic system, would undoubtedly have enabled a profit to be made from the outset. Under any circumstances, however, it is desirable to have a good deal of flexibility in the distribution arrangements—that is to say, ready means of enlargement to meet the increasing demand that experience has shown may be always expected, without unduly burdening the undertaking in its early days.

High Tension Feeders.—High-tension cables are perhaps the part of the distribution system which the engineer most fears, though nowadays to nothing like the extent of a few years back. The failure of a feeder means in many cases the total extinction of a large number of lights until a repair can be effected, and unlike the low-tension mains, which can easily be arranged to help each other, the failure of a high-tension main is difficult to economically safeguard. A good deal has been written of how high-tension feeders should be duplicated and interconnected, arranged on the ring system, and so forth, but in these suggestions a cardinal point is often lost sight of. A high tension system is adopted in most cases—though not in all—less on account of the intrinsic beauty of high tension than because it enables the supply station to be moved to a considerable distance from the area of supply to the site most favored as regards the supply of coal and water and freedom from liability to injunction. Hence, high-tension mains are often so long that their capital cost approximates power for power to that of the shorter low-tension feeder, and complete duplication is too costly to bear consideration. In this, as in so many other questions in which absolute security has to be balanced against cost, a compromise is the best solution. Two sub-stations lying fairly close together, each fed by a separate feeder, may be interconnected by a main of the same section as the larger of the two feeders. A breakdown will then mean more or less irregularity of voltage over the area supplied by the two sub-stations, but the period of total extinction need only last until the requisite connections between the sub-stations has been made. The use of a "discriminating cut-out" would even prevent the extinction, but at present there is but little experience available as regards this accessory, which promises, however, to be a most valuable invention. If the low-tension mains fed from each sub-station are permanently interconnected, or if arrangements allow of so connecting on emergency, the voltage variation may be still further lessened. Nowadays makers are willing to guarantee their cables over a period of years, and undertake to repair all faults at their own expense during this period—a proviso of singularly small use to the user, for a cable breakdown has in nearly all cases to be repaired by the station staff within a few hours of its occurrence. Cables are always tested at the makers' works after many hours' immersion in water at something like five times the working pressure. If they are then carefully laid and jointed by men experienced in the particular class of cable, and subjected to a further pressure test to try the joints and end connections, they may be relied on not to fail for electrical reasons with considerable certainty. The all-important thing in the case of heavy cables is that they should not be unduly strained or otherwise injured during the drawing-in, and if the insulation is hygroscopic, that great care be taken that the joints and end connections are kept free from moisture during the making and sealing up. Large cables are very heavy, but are easily damaged by straining, so that the use of a winch for drawing them in is to be deprecated. Half a dozen men pulling on a rope can only exert a limited force, and experience will enable the cable-layer to judge whether a given length and weight of cable is offering more than normal resistance, which may be due to inequalities in the conduit, and whether it is safe to employ more weight on the draw-rope. Breakdowns on good present-day cables are generally due to mechanical injury, such as the bursting of water-mains, the crushing of conduits by road engines, workmen's picks, and so on—accidents against which it is not possible to thoroughly guard. The broadest distinction in cables is that between the ordinary double and the concentric class. Between these two lies the twin cable, consisting of two separate side-by-side conductors, made up in one sheathing, and having a slow twist round each other. The latter may be said to be electrically nearly equivalent to the ordinary double cable and mechanically equivalent to the concentric. There are some striking differences in electrical behavior between these two main classes of cable. The double conductor has more self-induction for a given length and less capacity than the concentric. With small currents the inductive drop is not important, but with large currents, and when drawn into iron pipes, it becomes a factor to be reckoned with. With currents amounting to several hundred amperes its use becomes impossible for distribution work. On the other hand, on long lines the capacity current of a concentric cable comes into prominence, especially as it varies directly as the impressed voltage.

Most readers will be aware from published statements that the capacity current of the Deptford trunk mains, having a length when looped of nearly 12 miles, is between 12 and 14 amperes at the working pressure of 10,000 volts. This current, though wattless, has to be allowed for by increased section of copper in mains and generating machinery. The behavior of twin cables comes between these two classes. Their inductance is lower than that of a double conductor, and their capacity higher. They are largely used in systems where a quantity of double cable has been already installed, for the reason that it is inadvisable to use a combination of double and concentric mains. The capacity between the outer conductor of a concentric main and the earth has the effect of lowering the potential of the outer to the neighborhood of the earth potential. Connected to a system of double-conductor mains, the potential of one main is thereby brought nearly to earth potential, whereby the difference of potential between the other main and earth is nearly doubled. This has generally been found to produce disaster. In cases where nothing but concentric cable is in use it is becoming usual to connect all the outers to earth at the station switchboard, arrangements being made that they can be disconnected singly for testing in compliance with the Board of Trade regulations. For ease of handling, and ease and cheapness of jointing, the ordinary double rubber-insulated cable decidedly takes first place. Concentric joints are rarely satisfactory unless they are made in a special joint box. Hence, a multiplicity of joint boxes of different sizes and shapes have generally to be kept which, being usually the makers' patents, are costly. The earliest were insulated with vulcanized india-rubber, and the trouble experienced some years ago has, it is to be feared, greatly prejudiced engineers against india-rubber as a dielectric for this class of work. Yet at the present time rubber-covered cables can be obtained of great reliability, and their use offers many advantages for small feeders. Being very light and flexible, they can be drawn in for considerably

*From the *Electrical Engineer*, London.

greater distances than lead-covered cables. Jointing is simple and rapid, and no special boxes or end connections are required. However, the price of rubber is rising so rapidly that at the present time a lead-covered paper or jute-insulated concentric cable is considerably cheaper than two rubber-insulated cables of the equivalent section, and it cannot be denied that they are fast falling out of use. The other dielectrics most in use are paper from which all traces of moisture has been removed, impregnated with a heavy hydro-carbon oil, and fibrous material, such as jute, impregnated with special insulating compounds of a bituminous nature. Both these latter classes are protected from moisture by a solid-drawn sheath of lead, which is further protected by a serving of tape and preservative compound. Paper insulation is extremely weak mechanically and very hygroscopic, but so excellent is the manufacture of these cables that immense quantities have been laid and are working successfully. Of late a decided preference has been shown for armored cables, which can be laid direct in the ground without further covering than a tarred board to notify the whereabouts of the cable when the ground is opened for jointing or repairs, and, it is fondly hoped, to warn off the ubiquitous navvy's pick. An armored cable costs rather less than one of similar make and cross-section, lead-covered, and an iron or earthenware conduit, but it is difficult to see that this fact justifies their use in all cases. The possibility of drawing out faulty lengths, or lengths of insufficient section, rapidly and without disturbing the streets is very valuable, particularly when the undertaking is in the hands of a private company and the town authorities are apt to look askance at frequent requests for permission to open roads. But in spite of this great drawback its use is undoubtedly extending rapidly.

In the great majority of cases at present no provision is made for counteracting the drop in pressure in the high-tension feeders at full load, beyond raising the station bus-bar pressures slightly during the full load period. At best this method can hardly be considered fully to meet requirements, and in future design there can be little doubt that a transformer with variable change ratio, or some equivalent device, will have to be placed in each feeder circuit, in which case the station pressure would be kept constant at the value necessary for the shortest or lightest loaded feeder. An important point to which little attention is usually paid is the safeguarding of men working on mains which are usually kept alive. The procedure in many stations is something as follows: The electrician in charge of mains telephones or sends a message to the engineer at the station asking him to take off a particular main or circuit, and when he is satisfied that this has been done he tells the jointer to proceed to work on that main. If by mischance the main was not taken off the bus bars, or was afterwards put on prematurely, or the jointer cuts the wrong main, the responsibility may be difficult to fix upon the right person. Nothing can be better, however, than the method adopted in some stations whereby the jointer, having received his orders, goes himself to the station, and, with the permission of the engineer, opens the switch and places a wooden panel over the recess, which he padlocks, taking the key away with him. When the job is finished he goes back to the station and gives up the key. A main may sometimes be fed from both ends, and in this case some engineers provide a short-circuiting plug between the inner and outer at the sub station or transformer pit, and make it a rule that this plug shall always be inserted before any work is done. The outer main is of course permanently earthed at the station.

(To be continued.)

ELECTROLYSIS OF CAST-IRON WATER PIPES.*

BY HAROLD P. BROWN.

The injury of water pipes by electrolysis is at present so well understood that my only excuse for again calling your attention to the subject is found in the peculiar and unusual conditions disclosed at Dayton, O., in an examination made last July. This city has a population of about 90,000, fully 80 miles of electric roads and over 225 cars. Electrically considered, it is cut into four parts by the Stillwater and Mad rivers, which unite to form the Great Miami, and by Wolf Creek, meeting the Miami two miles or so below. Three of these parts are further subdivided by canals.

The business portion of the city is thus practically located upon an island, and the electric current used by the street cars must follow the rails across bridges or pass on the pipes under the river to get back to the power house. Practically 90 per cent. of the entire current from the business portion of the city crosses the river on one 12-in. and one 10-in. water pipe, one 8-in. gas pipe and one 10-in. natural gas pipe.

The two main power houses are about one-quarter mile apart on the west side of the Miami River. A third but smaller power house is on the east side of the river, but quite a distance south of the business portion of the city. Two other roads have their terminals in Dayton, but their power houses are elsewhere.

Following my ordinary methods, a switchboard was mounted on a wagon, with a complete set of Weston electrical instruments, reading from 0.0001 volt per degree up to 750 volts and from one-half ampere to 150 amperes. At each hydrant along the electric roads of the city a reading was taken from the trolley wire to each of the four rails, from the trolley wire to the pipe and from the pipe to each of the rails. These measurements were made in sets of three in such a manner that any poor contact or any defective condition of the testing apparatus was at once indicated and corrected. The instruments had recently been compared with standards, and were known to be correct.

Over twenty-five hundred electrical measurements were made, and the results of the readings were plotted out upon a map of the city. Fifteen excavations were made, and the measurements repeated on the pipes themselves. A careful examination was then made of the physical condition of the pipes by J. H. Shaffer, metallurgist, and chemical analyses were made of samples of soil and the metals of the pipes and incrustations upon them. These were made by E. E. Brownell, E. E., and Jas. O. Handy, chief chemist.

These electrical tests showed that the pipes in the business portion of the city, 1½ to 2 miles from the power houses, were positive to the rails, and therefore subject to electrical corrosion. The highest readings in this part of the city were 4½ volts near Fifth Street Bridge and near Washington Street Bridge. Near the power house on the west side of the river the pipes were 9 volts positive to the rails, and the danger district extended about three-quarters of a mile to the west. In the southern part of the city the highest positive reading was 2 volts in front of the Oakwood avenue power house.

In making the electrical tests the time of the reading was noted, since the pressure depends on the amount of load carried at the power house, and will vary correspondingly in all parts of the city. For instance, in front of the power house of the People's Railway, on Washington street, at 5 P. M., during the heavy load, the pipes were 9 volts positive to the rails, while at 2 P. M. they were but 6 volts positive.

*Abstract of paper read before the meeting of the American Society of Municipal Improvement at Washington, D. C., Oct. 21, 1898.

It was at once evident that the danger district was extremely large, since in the area in which the pipes are positive to the rails they are liable to injury. This was verified by the records of the water board, which showed a large number of service pipe renewals. Unless a remedy for the electrical condition of the pipes is very quickly applied in Dayton it is certain that a large amount of excavating, replacing of pipes and paving will need to be done.

Cast-iron pipe is usually not affected by electrolysis, since the coating of adherent molding sand and tar paint protect it. In the ordinary soil an iron pipe submitted to electrolytic corrosion is covered with a layer of iron oxide, which is a poor conductor of electricity, so that with a given pressure, the deeper is the layer of rust and the slower the rate of corrosion. But, to my surprise, the soil surrounding pipes in Dayton gives an entirely different reaction when a current passes through it. The tar seems to be no protection whatever, and the surface of the pipe in the danger district is changed into a soft, black material resembling graphite and easily cut with a knife.

This material is such an excellent conductor that instead of checking, it tends to increase the action by reducing the resistance of the path through which the current must flow in order to reach the rail. Moreover, the stones and pebbles near the pipes are actually electro-plated with the metal of the pipe, whether iron or lead. This condition I had never before seen, and, as far as I know, it has not been previously reported. Since my Dayton report was published I have received a letter from Dabney H. Maury, Jr., superintendent of the Peoria Water Company, Peoria, Ill., in which he states that he had encountered the same phenomena.

In order to electrically deposit a layer of metal two things are necessary, first, a liquid which will dissolve the metal, and second, an electrical current exceeding 0.01 of a volt in pressure flowing away from the metal through the liquid. The fact that the pebbles are electro-plated showed that both these conditions exist, but in order to prove conclusively that the soil itself did not injure the pipes a pipe surrounded by the same soil was uncovered in another portion of the city where there was absolutely no trace of an electrical current. This pipe was on Logan street, near the canal; the records showed that it was put down in 1874, while the pipe taken out at the west end of Fifth street bridge had been in use ten years and exposed to electrolysis for four years. If the damage was caused by the soil itself, this pipe would, of course, have been in a worse condition than the Fifth street pipe, but the Logan street pipe was apparently as good as new.

To make the comparison absolutely beyond criticism, a section of each pipe was taken out, chemically analyzed and mechanically tested. The chemical analyses of the iron pipes were nearly identical, and are as follows:

	Logan Street Pipe. Per Cent.	Fifth Street Pipe. Per Cent.
Phosphorus	.789	.800
Sulphur	.073	.037
Silicon	2.270	2 500
Iron	Not det.	Not det.
Carbon combined	.13	.21
Carbon graphitic	3 43	2.88

The samples of the incrustation of the Fifth street pipe analyzed as follows:

	Per Cent.
Phosphorus	1.821
Sulphur	None
Silicon	Not det.
Iron	33 43
Carbon combined and carbon graphitic	7.12

This analysis showed that the percentage of iron was greatly diminished, while the percentage of carbon was more than doubled; careful investigation showed that the carbon was merely the amount originally in the pipe, the carbon being left, while a large portion of the iron had been carried away. The

chemical analyses of the soil showed that the solvent was produced electrically from carbonate of sodium and chloride of sodium in the soil. Neither of these by itself in the small proportion shown by the analysis would injure a cast-iron pipe covered with tar, though, as is well known, a strong solution of chloride of sodium or common salt will rust wrought iron, but in the presence of even 0.01 per cent. reduces the electrical resistance of the iron, and the passage of the current decomposes those salts and forms muriatic or hydrochloric acid, which dissolves the metals. Having thus determined the cause of the trouble, it remained to fix its extent. Fifteen excavations were made in different parts of the city to determine how much electrical pressure is required to seriously injure the cast-iron.

A pressure of 3 volts and less is found to cause a graphite coating not exceeding 1-32 inch in depth; the iron seems to be uninjured. From 3 to 4½ volts the thickness of the layer is increased in a ratio depending upon the length of time during which the pipe has sustained this pressure. With a knife or file soft spots can be found in a pipe from 1-16 inch to ¼ inch deep. With higher electrical pressures the extent of the injury is even greater. In all cases the damage is directly proportional to the pressure and to the length of time during which the current has been flowing, while it is inversely proportional to the distance between the rails and the pipes. In my opinion, all main and service pipes in Dayton are seriously injured where submitted to 3 volts pressure or more for two or more years when within 4 feet of the rails. This would mean less than one mile of mains, but with lead or wrought iron service pipes the pressure limit would be as low as one volt. Charles E. Rowe, secretary of the waterworks, however, feels that 17,513 feet of mains should be replaced at a cost of $77,000.

To determine what percentage of mechanical injury has been sustained by the pipes it was intended to compare the hydrostatic pressure required to rupture the Logan street and the Fifth street pipes, but defects in the apparatus employed prevented a fair test. The Fifth street pipe at 150 lbs. pressure leaked through the corroded spots, while the other pipe was able to stand 300 lbs. pressure. Test bars were cut from the best portions of both pipes, and broken on a Riehle testing machine. The average transverse strength of the Logan street pipe was 1,800 lbs. per square inch, as against 1,085 lbs. to the other. The tensile strengths were respectively 16,000 and 11,425 lbs., and the deflections were 0.25 and 0.20 in. Four years of electrolysis had robbed the Fifth street pipe of about 30 per cent. of its transverse strength and about 45 per cent. of its tensile strength, and had caused it to leak at 150 lbs. pressure.

Since I wished to avoid any suspicion of unfairness, I asked the managers of each of the three leading electric roads to allow their experts to accompany me, and to check my instruments, methods and readings. This was cheerfully done, and I received from the gentlemen information concerning their plants and connections, as well as every possible courtesy, during my examination.

The rail joints on several lines of road had recently been removed, the rail ends brightened with the sand blast and the "cast weld" joint applied. This was done by the railways with an idea that it would reduce electrolysis, as well as make a fine mechanical joint. It was a success mechanically, but was an electrical failure, as was shown by tests of individual joints and by electrical measurements of several stretches of 1,000 to 1,200 ft. of the four rails and of the pipes below them. The measurements were compared with others made last February on same rails before the "weld" was applied, when very small bond wires were used on the rails. There was practically no variation in the results, as would have been the case had the "weld" possessed high electrical conductivity. I found that two of the rails were carrying no current whatever, while the other two carried but one-twentieth of the amount of the current on the pipes below them.

I feel confident that if the railroads would unite in the expenditure of $5,000 to $7,000 for the proper electrical apparatus and connections, all the water pipes in Dayton could be maintained negative to the rails. Then the pipes would harden, as is the case with the section of the pipe which I have brought to show you. Moreover, any further electrolysis that might occur would be in the opposite direction, and would therefore add a layer of metal to the pipes instead of injuring them. I will not here enter into a discussion of the electrical methods required in Dayton to obtain this result, but it is evident that no plan heretofore suggested for electrolysis prevention will effect a cure there, owing to the unusual conductivity of the soil and the peculiar division of the city.

I should like to offer a few comments and four or five practical suggestions. Do not imagine because your pipes are not leaking or bursting that they are safe from electrolysis. If the electrical conditions are against them they are getting weaker day by day. On the other hand, do not antagonize the railway companies the moment that the subject of electrolysis comes up in your city. They are not intentionally injuring your property, and if a friendly talk is had and a joint investigation is made, you are likely to get the speediest and most satisfactory action. The railway manager is as much interested in stopping the trouble as you are; every pound of metal taken from your pipes means to him a heavy loss of power, increased investment for engines, boilers, dynamos and conductors, and if it is finally established by legal decisions that his current has injured your property he will have to settle the bill.

The best course for all concerned, it seems to me, is to take mutual action while that bill is small, and not wait until a bursting main during a fire spreads the loss over the entire community. The usual procedure brings a deadlock. The waterworks people discover signs of electrolysis, and at once pounce upon the railway managers. They either refuse to believe that they are responsible for the trouble and thus bring upon themselves a shower of threats, or they say that, although they cannot admit the fault is theirs, they are, nevertheless, willing, rather than earn the ill-will of the public, to do anything in reason if the others will only tell them what to do. Then the others suspect some cunningly hidden legal trap, and decline to give any directions whatever; and so nothing is done.

The following will be found practical suggestions:

(1.) Obtain complete and accurate information concerning the electrical, chemical and mechanical conditions of your pipes, especially in the vicinity of the power houses. The trouble may be confined entirely to the lead in the service pipes and in the calking of joints on your mains, but even here serious damage may result if the matter is neglected for years.

(2.) Do not put down any more lead or wrought iron service pipes, as these are the first victims of electrolysis, and their replacing means ruin to pavements. Use instead wooden pipe banded with a close spiral of hoop iron and covered heavily with asphaltum. This will stand the heaviest pressure in use, and is not affected by electrolysis, since the hoop iron is low in conductivity and is not electrically connected at the joints. Its cost is said to be reasonable, and it has a successful record of many years' service.

(3.) Use the same kind of pipe for new mains in any district in which a railway power house is likely to be erected, and heavily paint the red calking of cast iron mains, using asphalt or petroleum wax.

(4.) In the danger district along the lines of electric roads and on intersecting streets put into your water and gas mains two or more consecutive lengths of those wooden pipes, so as to break the electrical continuity of the mains, and thus make their resistance greater than that of the rails. Fill in the space around them with broken stone and connect with drain, if possible.

(5.) Midway between the wooden sections on each main attach insulated pilot wires, leading to a central office. Connect similar wires to the rails nearest the pipe wires, and make daily electrical tests at times of heavy load. If any section shows positive to the rails cut it at once into smaller sections, and call upon the railway to rebond its line upon that street. This, with proper electrical management of the railway feeder wires and apparatus, will effectively protect your mains.

"ELECTRIFICATION" OF STEAM RAILROADS.

Prof. Sidney H. Short, who recently sailed for Europe, writes in the January *Cosmopolitan* to explain how in the next fifteen years, unless there should be an unexpected slump in electrical progress, steam will be superseded by electricity as the motive power for even the trunk-line railroads. The change will mean, he says, the reduction in time between New York and Chicago to ten hours, and a general readjustment of business and social conditions to a standard of 125 miles per hour instead of 40. This revolution will come, he thinks, without any great sacrifice in railroad properties and without radical departure from present methods of railroad construction.

The chief difficulty in the way of this great revolution is the waste which conservative railroad men always point out that it would bring to the enormous railroad plants already in operation. In the matter of locomotives alone there are now 30,000 steam engines in the United States in service, and if they only cost $10,000 each, it would mean that some $300,000,000 worth of machinery would have to be sold as scrap-iron, as they could probably not be adapted to electrical service. It has been estimated that the cost of installation of an electrical plant—conductors, locomotives, motors and cars—for a single railroad system such as the Pennsylvania would reach $100,000,000.

Prof. Short thinks that it would be much more feasible than some railroad men think to change the plant. Running over an inventory of the items in a steam railroad property of to-day, he finds a great number of the assets of a sort which would not have to be changed—real estate, office and terminal buildings, stations, round and car houses, repair shops, roadbed and appurtenances for its control and protection, passenger and freight car bodies, car-trucks, and many of the locomotives. All mentioned here, except the car-trucks and locomotives and the general repair shops devoted to locomotive work, would continue in uninterrupted use.

Prof. Short then takes the case of a railroad running by steam, and goes into the details of the cost of changing it. He suggests that as fast as a steam freight locomotive should become superannuated—and the life of such a machine is just so many years—an electric locomotive should be substituted, and thus in time the whole equipment would be changed.

Aside from the enormous advantage of greater speed, there are obvious economies in fuel and repairs. Five pounds of coal in a steam locomotive are now required to do what one and a half pounds will do in a stationary plant. The cost of fuel per HP. per hour would be brought down to a half cent, and if gas-engines were used to still less.

"The cost of repairs," Prof. Short adds, "would be enormously reduced, in spite of the greater speed obtained. Track life would lengthen with the gradual elimination of the locomotive, and repairs to a motor are both less costly and less troublesome than to a locomotive. The electric motor runs without intermission, requires little attention, and gives

an output far in excess of that demanded of any other machine in hard service. While it may not be asserted that electrical apparatus is invulnerable or that the mighty power which we drive through devious ways finds its pathway always free from obstruction, it is true that correctly designed and well-made electric railroad apparatus is of lasting utility."

"WOOD'S SYSTEM" DYNAMOS.

The following appeared in the Metropolitan Holiday Supplement of the N. Y. *Tribune*:

The West has kept pace with the progress of electrical industries, and the excellence and merit of many of the products of Western plants are fully recognized in the commercial world. Among the well-known concerns of the United States is the Fort Wayne Electric Corporation, whose machinery and apparatus are manufactured exclusively from the designs of James J. Wood. Mr. Wood has probably had a larger and more varied experience in designing electrical machinery than any other individual in the country, having devoted himself to this line of endeavor since 1867. The fact that the manufacture of apparatus by this corporation is carried on under his personal supervision is in itself a high guarantee of efficiency, excellence of electrical and mechanical design and the superior workmanship and finish which have made the product of the Fort Wayne works well known throughout the country.

The Wood constant-current dynamo for arc lighting is designed and constructed to meet the rigid requirements of central station work. It has an efficiency of 90 per cent. at full load, and is absolutely automatic in its operations. The bearings are self-oiling, and can be removed for inspection or repair without breaking a single connection or removing the armature from the machine. The regulation of this dynamo is accomplished without the aid of accessory devices. The armature is of improved design, and the commutator is large and of ample capacity.

The company manufactures direct-connected arc dynamos, with field switch of new design and construction. One of its standard types of arc machines is the eighty-light dynamo, of which the sales during the last four years have amounted to nearly fifty thousand lights capacity. It now has improvements which have lowered the maximum temperature of the armature 25 degrees centigrade, and have materially increased its efficiency. The Wood patent arc lamps are manufactured in various styles and are adapted to all purposes to which lighting may be applied. A noticeable feature of the arc lamp mechanism manufactured by this company is the extreme simplicity and ease with which they can be repaired. The new electric headlight made by the company for use on vessels or wherever a powerful beam of light may be required to be projected in all directions combines beauty of appearance with substantial construction and simplicity of operation. The electric searchlight also has many features to commend it to pilots. A specialty is made of street lamps and mast-arms, by means of which lamps may be conveniently hung over the streets where the sidewalks are lined with trees.

The Wood system of alternating machinery and apparatus has won a high place in the electrical world. During the last three or four years the compound alternators for light and power manufactured by this concern have continued to grow in public favor and its system has made friends wherever installed. The apparatus embodies a high degree of perfection and excellence of design, which has been the result of careful scientific and practical study and investigation.

As is well known, the low tension systems, on account of their great cost for conductors, are not commercially suited for supplying electric lights at a distance exceeding one-half mile from the central station, and for greater distances the alternating system is specially adapted.

Electrical experts also speak most favorably of the direct-current machinery and apparatus manufactured under the Wood system by the Fort Wayne Electric Corporation.

UNDERWRITERS' NATIONAL ELECTRIC ASSOCIATION.

The meeting of the special committee of the Underwriters' National Electric Association appointed to draw up specifications for wire coverings, to compile a list of fittings acceptable for use under the rules and to take up other matters in connection with the National Electrical Code, will be held at the offices and laboratory of the Electrical Bureau of the National Board at 157 La Salle street, Chicago, beginning January 9th. The committee is composed of W. H. Merrill, Jr., chairman; J. C. Forsyth of the New York Board of Fire Underwriters; E. V. French of the Associated Factory Mutual Insurance Companies; Wm. McDevitt of the Philadelphia Fire Underwriters' Association; A. M. Schoen of the South Eastern Tariff Association; J. B. Cole of the Boston Wire Department, and Edward B. Ellicott, City Electrician of Chicago. Acting with the committee will be E. A. FitzGerald of the Underwriters' Association of New York State, A. E. Braddell of the Underwriters' Association of the Middle Department, J. M. DeCamp of the Suburban Underwriters' Association, Franklin H. Wentworth, Theodore Varney, W. S. Boyd and Benjamin H. Glover of the Electrical Bureau, and a number of other officials. The manufacturers of insulated wire have been invited to be present at certain hours during the meeting when the experimental records on their products will be under discussion and the following specifications for rubber wires prepared by the Electrical Bureau will come up for action:

Wire Insulation.—(a) Rubber—Insulating compounds containing rubber must conform to or be in excess of the measurements given in the following table, which shows standard thickness of insulating walls for standard wires and cables:

B. & S.	Mils. Thickness of wall.	Mils. Diameter over rubber.	B. & S.	Mils. Thickness of wall.	Mils. Diameter over rubber.
18	.0411	.122	4	.0821	.568
16	.0437	.138	8	.0883	.406
14	.0169	.158	2	.0954	.448
12	.0512	.183	1	.1033	.493
10	.0565	.215	0	.1122	.549
8	.0631	.255	00	.1222	.609
6	.0715	.305	000	.1334	.676
5	.0764	.335	0000	.1460	.752

The above table is based upon the following formulæ, which may be applied for conductors larger than No. 0000.

Rubber diameter equals 3.2 copper diameter plus 62.

Thickness of rubber wall equals one-quarter copper diameter plus 31.

As the dielectric strength of a rubber wall is determined by its thinnest portion, all measurements shall be taken across the smallest diameter of the specimen tested. When depressions are caused by the braid or in process of manufacture, the lower surfaces of the channels caused by these depressions must be taken as the exterior surfaces of the wall. For a correct reading the measuring instrument must just shut out a line of light between the material being measured and the terminals of the instrument. All of these insulations must be protected by a substantial braided outer covering sufficiently strong to withstand all abrasion it will meet with in practice and sufficiently elastic for all wires smaller than No. 5 B. & S. gauge to admit of the conductor being wound back over itself without injury to the braid.

The completed covering must show an insulated resistance of at least 100 megohms per mile, throughout eight weeks' immersion in hydrant water at ordinary temperatures. Each foot of the completed covering must show a dielectric strength sufficient to resist throughout five minutes the application of an alternating EMF. of 16,000 volts under the following conditions: The source of alternating EMF. shall be a transformer of at least 1 kilowatt capacity. The application of the EMF. shall first be made at 4,000 volts for five minutes and then the voltage increased by steps of not over 3,000 volts, each held for five minutes until the rupture of the insulation occurs. The tests for dielectric strength shall be made on a sample of wire, one foot of which is submerged in a conducting liquid held in a metal trough, one of the transformer terminals being connected to the copper of the wire and the other to the metal of the trough.

SOCIETY NEWS.

American Institute of Electrical Engineers.

A meeting of the Institute was held at 12 West 31st street Wednesday, December 28, Mr. John W. Lieb, Jr., in the chair. A paper was read by Mr. A. A. Hamerschlag, of the New York Trade School, on the "Education of Electrical Apprentices and Journeymen." It was illustrated by lantern slides, showing the work by the electrical and other trade classes at the school. The discussion which followed was participated in by Messrs. Wetzler, Lieb, Thompson and Pope.

At the meeting of the Executive Committee in the afternoon the following Associate Members were elected:

John Allan, Sydney, N. S. W.

John Jacob Bellman, Electrical Engineer of the Crocker-Wheeler Electric Co., New York.

Robinson Crowell, Electrical Tester of the General Electric Co., Schenectady, N. Y.

Henry B. Dates, Prof. of Electrical Engineering and Physics, Clarkson School of Technology, Potsdam, N. Y.

John C. Finney, Cashier, Wisconsin Trust Co., Milwaukee, Wis.

Wm. N. Gladson, Prof. of Electrical Engineering Arkansas Industrial University, Fayetteville, Ark.

Leo Walter Hildburgh, student, Columbia University, New York.

William B. Hodge, Electrical Engineer of Elmer G. Willyoung & Co., Philadelphia, Pa.

Saitaro Oi, Chief Engineer to the Bureau of Telegraphs, Ministry of Communications, Tokyo, Japan.

Francis E. Tyng, Manager Eastern Engineering Co., New York.

Arthur J. Wood, Associate Editor *Railroad Gazette*, Brooklyn, N. Y.

Exports of Electrical Material from New York.

The following are the exports of electrical material from the port of New York for the week ending December 31:

Australia—44 cases, $3,700.
Berlin—2 cases, $200.
Brazil—33 cases, $1,748.
Bremen—1 case, $315.
British East Indies—9 cases, $210.
British Guiana—8 packages, $83.
British Possessions in Africa—1 case, $60.
British West Indies—21 packages, $663.
Central America, 189 packages, $4,838.
Cuba—35 cases, $2,441.
Ecuador—45 packages, $952.
French West Indies—1 package, $18.
Genoa—3 cases, $163.
Hamburg—121 cases, $18,359.
Hayti—5 packages, $187.
Havre—5 packages electrical vehicles $1,675.
Liverpool—57 packages electrical material, $2,063.
London—1 case electrical instruments, $550; 116 cases electrical machinery, $3,800; 16 cases electrical material, $612.
Manchester—1 case, $300.
Marseilles—2 cases, $100.
Milan—1 case, $20.
Peru—18 packages, $341.
Santo Domingo—4 packages, $45.
Siam—11 packages, $574.
Venezuela—278 packages, $698.

LEGAL NOTES.

At Harrisburg, Pa., on the 27th ult., Judge McPherson handed down an opinion in the case of the Commonwealth of Pennsylvania vs. the Keystone Electric Light, Heat & Power Company of Gettysburg, in which he orders judgment to be entered against the defendant company, that it be ousted and altogether excluded from exercising the franchise of the Electric Light, Heat & Power Company of Gettysburg, and also from the franchise or privilege to be a corporation by the name of the Keystone Electric Light, Heat & Power Company or by any other name.

An electric passenger railway on a country highway is held in Zehren vs. Milwaukee Electric Light & Railway Company (Wis.) 41 L. R. A., 575, to constitute an additional burden which requires the consent of the abutting owner and payment of compensation.

The Havana City Railway Company has brought a suit in New York against J. M. Ceballos, F. R. Robl, Francisco Pla and the American Indies Company, to compel them to turn over to the railway company the franchises for constructing the street railways in Havana. On Friday last J. J. Adams, representing Ceballos and Robl, made a motion before Judge Scott to compel Kisch & Roberts, attorneys for the plaintiffs, to disclose their authority for bringing the suit, and also to state where Hugh Alexander and Eugene Sweeney, two of the members of the Havana Street Railway Company, reside. Mr. Kisch, in his argument, said that Alexander was a resident of East Orange, N. J., and that Sweeney resided in New York City. He stated that the Havana Street Railway Company was a duly organized company and had spent considerable money in perfecting plans, etc., for constructing a street railway in the Cuban city, but that upon the outbreak of the war the work had been abandoned for the time being. He said that Mr. Ceballos had in his possession the papers transferring the franchise from the original owner, Francisco Pla, to the Havana Street Railway Company, and that since the end of the war he, with others, had organized the American Indies Company with a capital of $18,000,000, and that it was the new company's intention, if possible, to get control of the franchises. Judge Scott reserved his decision.

THE NEWS.

What is Going On in the Electrical World.

LIGHTING.

Albany, N. Y.—The board of supervisors has adopted a resolution empowering the military committee to make an investigation of the proposition to equip the armory and public buildings with a suitable electric lighting plant.

Cincinnati, O.—City Electrician Klein is at work on a plan which will revolutionize the repair of sewers. He is perfecting a portable mechanism for lighting large sewers with incandescent lights so that a stretch of about 2,000 feet can be lighted at once if necessary. The idea is to use a pole line, or an independent portable battery. The use of torches for illumination has been found to be a fearful strain on the men. A short stay in the sewer, breathing the torch smoke, causes great suffering to them. The sewers also contain gasoline, which is discharged from dye houses, and this is liable to be ignited by the torches and cause explosions.

Cuero, Tex.—The Buchel Power & Light Company has bought the plant of the Cuero Electric Light & Power Company. This puts an end to the light fight that has been on for some time.

Dayton, O.—A resolution passed by the city council on the 23d ult. directs the city engineer to report an estimate of the cost of constructing an electric light plant in Dayton, including the cost of machinery, engines, boilers, buildings, poles, wires, lamps, etc. It is proposed at the April election to submit to the voters the question of issuing bonds for the purpose of constructing a plant of this character.

Glassboro, N. J.—The Gloucester County Electric Light Company has been granted the privilege of furnishing electric light to the township of Glassboro by the township committee. The township is at present using old coal-oil lamps, and the citizens are jubilant over the assurance of electric illumination.

Great Bend, Kan.—The residents of this place are in a bad fix, outsiders say—they have no lights and no beer. They ought to straighten up and get lights at all events.

Henderson, Tenn.—The electric light plant has been in operation for two weeks and nearly all the citizens are liberal and substantial supporters of the company. The business houses and many residences are lighted.

Humboldt, Ia.—On the 23d ult. this town voted to permit a home electric lighting plant to be put in for the full limit of the law, twenty-five years. The majority was large.

Ogden, Utah.—The proposition of the Union Light & Power Company to furnish street lights for the coming two years has been accepted and the contract approved.

Pierre, S. D.—The city has concluded a deal by which it gets control of the electric light plant, which has heretofore been conducted by a private corporation.

Pittsburg, Pa.—Morris W. Mead, superintendent of the Bureau of Electricity, is busy at present rearranging the rules governing electric light inspection. He says there are so many kinds of manufacturing establishments in Pittsburg where acids are in use that it has been found necessary to change certain of the rules in order to meet all local cases. All the ordinances and resolutions that have been passed and which bear on the subject will be incorporated in the new rules.

Portland, Ore.—The construction committee of the Water Committee has been instructed to ascertain the probable cost of installing and maintaining an electric plant of sufficient capacity to light the city. The city now uses 703 arc lights of 2,000 candle-power each and 637 incandescent lamps of 25 candle-power each. The construction committee consists of Messrs. Corbett, Dolph, Therkelsen, Teal and Lowenberg.

Savannah, Ga.—The Edison Electric Light Company, which proposes to put in a new plant in Savannah, has within the last week or two made strong efforts to get control of the stock and plant of the Brush Electric Light Company, the only company which has a plant in the city. The stock has been selling on the market at about 70, but the Edison company has offered as high as 90 for 90 per cent. of the stock. The Edison Company has been endeavoring to get a foothold in Savannah, and the outside gossip is that they were convinced that there was not business enough in the city for two lighting and power companies.

St. Helena, Cal.—The board of town trustees has granted a franchise to the St. Helena Light & Power Company permitting it to erect and operate an electric light plant in this town. It is expected that the plant will be in running order early in April.

STREET RAILWAYS.

Albany, N. Y.—The Albany Construction Company, W. H. Schermerhorn, of Brooklyn, president, incorporated for the express purpose of building the Albany, Helderberg & Schoharie Electric Railway Company's road, is now ready to sublet contracts for rails, ties, material, etc. The work of construction will be begun as soon as the weather permits. A survey has been filed with the county clerk and another copy of the proposed route will be filed with the board of railroad commissioners.

Biddeford, Me.—A contract has been entered into with Isaac A. Walker & Son of Philadelphia for the building, equipping and operation early next summer of the Saco River electric railroad from the Biddeford line to Bonny Eagle in the town of Standish. The road is expected to be first-class in every particular.

Carrollton, Ky.—An Eastern firm has guaranteed the building of the Carrollton electric railway. The greater portion of the $75,000 necessary to build a bridge across the Kentucky river has been procured.

Frederick, Md.—Several of the incorporators of the Frederick, Thurmont & Northern Electric Railway have arranged to meet some well-known capitalists in Baltimore, when an effort will be made to interest them in the construction of the road. From Baltimore the incorporators expect to visit Washington for the purpose of having an interview with the promoters of the proposed electric line from Washington to Gettysburg by way of Frederick.

Hartford, Conn.—A large number of petitions will be presented to the incoming Legislature for new trolley roads or extensions. The present mileage of trolley roads in Connecticut is a little over 490, and the projects set forth in the new petitions represent about 300 additional miles, of which about 140 miles, if built, would parallel steam roads. The proposed parallels are a new line from Hartford to New Britain, three lines from New Haven to Derby, two lines from Middletown to Hartford, and lines from Hartford to Winsted, from Naugatuck to Beacon Falls, from Ansonia to Seymour, from New Haven to Wallingford, from Norwich to New London, and from Southington to Waterbury, Mount Carmel, Plainville, and through certain streets of Meriden. At least eight of these schemes are sure to encounter resistance from the New Haven Railroad Company.

Kokomo, Ind.—Charles L. Harry, superintendent of the Kokomo Street Railway Company, has filed petitions with the commissioners in Tipton and Hamilton counties, asking for the right-of-way and the privilege of building an electric railroad extending from Tipton south through Atlanta, Arcadia and Cicero to Indianapolis. E. H. Shirk, president of the Tipton National Bank, is also interested in the proposed road.

Louisville, Ky.—James G. Wright, secretary of the Louisville, Mt. Washington & Fairfield Electric Railroad, which is as yet in process of development, has addressed a communication to the Mayor, asking him to request the Board of Works to take action on his petition for right-of-way through certain streets in this city.

Plainfield, N. J.—The city council at its meeting on the 20th ult. granted a franchise for the last connecting link in the trolley system which will connect New Brunswick and Newark. In the contemplated system of trolley extension from Philadelphia, Newark, New Brunswick, Somerville and Plainfield are now connected by trolley, and the franchise has been granted from Plainfield to Elizabeth. The franchise just granted is for less than a mile, but has been a bone of contention since last summer.

Pontiac, Mich.—The township board of Rochester has granted a franchise to John Winters and O. H. Lau of Detroit for an electric railroad to this city, this branch to make connections with the proposed line to Orion, of which Messrs. Winters and Lau are the promoters. A line will be run from Detroit to Rochester if present indications materialize. The Rochester line will connect with the Orion-Pontiac line about one-and-a half miles south of Ball Mountain.

Wadsworth, O.—Attorney George D. Hile, of Cleveland, representing the Cleveland, Wadsworth & Southern Street Railway, has asked the council for a franchise to build and operate a street railway in Wadsworth and to furnish power, light and heat and telephone service.

MANUFACTURING, ETC.

Chicago.—The Fisher Equipment Company of this city is reported to have entered into a contract to furnish $1,000,000 worth of electrical vehicles, to be sold in Europe in the next ten years. Count de Jotemps of Paris, president of the American Motor General Agency of Paris, negotiated the deal for his company. Count de Jotemps says that his company will open its Paris office on the Champs Elysees on March 15, and will soon establish branches in London, Berlin, Vienna and Brussels. His company has a capital of $2,000,000. The first shipment of vehicles from Chicago will be made this month.

Providence, R. I.—The "Telegram" learns from Mr. Eugene Phillips of the American Electrical Works that the great wire trust which has been reported for some months as in process of formation is now an accomplished fact or will be on the 10th of January, and that the name of the concern will be the American Steel & Wire Company. Mr. Phillips says the trust will not have any great effect on the manufacture of wire in Rhode Island, as the class of goods turned out by the American Electrical Works is much smaller than that which the new combination desires to control. The biggest concern in the East which has entered the combination is that of the Washburn & Moen Company of Worcester.

Syracuse, N. Y.—The Crouse-Hines Electric Company of this city doubled its capacity during the past year in the way of additional space, new machinery and a larger force of men. Employment is now given to forty-five persons and the plant is kept in operation every night until 9 o'clock. High grade electrical apparatus is turned out by this company and extensive sales are made in all parts of the United States and Canada. The company believe that the situation warrants further enlargement of their business and an effort will be made to increase the capacity to a further extent the present year.

Washington, D. C.—The British Government has extended an invitation to the United States to take part in the Western Australian International Mining and Industrial Exhibition which is to be held at Coolgardie in March, 1899, under the patronage of the Government of Western Australia. The opportunity afforded to American exhibitors is one of especial value and importance in view of the fact that Western Australia, by its rapid development, its great resources, and its unlimited prospects, affords exceptional openings for American goods. The Exhibition will be intercolonial in its character, and will be attended by many visitors from the whole of Australasia. The following, among other classes of manufacture, will find special scope for exhibition, and, if so desired, of sale, viz: Electric motors, lighting apparatus, wire, and electric appliances of various kinds. The Exhibition will be opened on March 21, 1899, and continue open for a period of at least three months.—The attention of the electrical industry is also called to the fact that a Provincial Exposition of East Flanders will be held at Ghent during the summer of 1899, being opened June 14. While the principal exhibits will naturally be made by the residents of the province, there will be a department for foreign exhibitors. The Exposition will furnish the best opportunity ever offered to introduce our electrical goods to the markets of Ghent and the Flanders, and is worthy the attention of American manufacturers and exporters.

POWER AND TRANSMISSION PLANTS.

Bridgeport, Conn.—The Housatonic Power Company has given notice that it will petition the General Assembly for an amendment to its charter, giving it the right to build a dam across the Housatonic river between the towns of Bridgewater and Brookfield, at or near the village of Southville, and the right to conduct electricity from New Haven County to points within Hartford County. It is the intention of the company to obtain power from the waterfall, to be created by the construction of one or more dams, for the purpose of generating electricity.

Helena, Mont.—The big dam and power house at Canyon Ferry, on the Missouri River, sixteen miles

from Helena, have been completed, and electric current, transmitted from the plant to this city, is now supplying power to many industries in the city and vicinity. In the construction of the dam the labor of 250 men was required for two full years, at a cost of half a million dollars. In it were consumed 3,000,000 feet of timber, 45,000 cubic yards of earth and 50,000 cubic yards of granite, quarried at the dam site. Four large penstocks about 50 feet long and 45 inches in diameter, each containing water wheels revolving at the rate of 147 times per minute, furnish the primary power, which is equivalent to about 12,500 horse power, but this may be increased in the ratio of four to ten, or 31,250 horse power, should the occasion so demand.

Minneapolis, Minn.—The St. Anthony Falls Water Power Company has closed a contract with the General Electric Company of New York for completing the equipment of its power house at the lower dam with electrical machinery. The new equipment will probably be ready for use by July 1, and the new power created will be used for street railway purposes and for general use by manufacturing plants throughout the city. The power plant will then be of a capacity of 10,000 horse-power at a low stage of water, all of which is created and run by the water power developed at the lower dam, and is in addition to nearly three times that amount of power which had already been developed and was in use at the upper dam.

Richmond, Va.—The Virginia Electric & Development Company, of which J. C. Todd, of Baltimore, is president, is ready to proceed with the project for electrifying James river here. The common council of Richmond has concurred in an ordinance passed by the upper branch authorizing the Virginia Electric Company to transfer its franchise for this purpose to the new corporation, or, as a matter of fact, change the name of the same. The $5,000 bond given by the old concern was also transferred to the new one. The parties interested in the Virginia Electric Company are the same as those in the corporation which succeeds it.

Pittsburg, Pa.—Details of the plan of the Miller Electric Construction Company for utilizing the power of the falls of Niagara are given in the Pittsburg "Post." In the first place it is expected to erect a large building, 600 feet long and 100 feet wide, which is to be moored and securely fastened in close proximity to the falls. The structure is to be built of metal, its principal feature being structural iron and steel. The building is to be six stories high, and will have a floor space of 360,000 feet, or 60,000 feet on each floor. The interior is to be used for manufacturing purposes. The entire bottom will be constructed of steel plate. It will have another bottom constructed of vacuum copper cans, each of which will be two feet square. It is proposed to pump these full of air to give the building sufficient buoyancy. It will be kept in place by a system of anchors and heavy iron cables. The current at the point where the building is to be located is not swift, it being what is known as a back current, and will assist in keeping the building in proper position. From the end of the building next to the falls are to project huge structural steel arms, 150 feet long, which swing up and down on a pivot. On the end of the arms are to be placed turbine wheels 12 feet wide, with a diameter of 18 feet, which will be thrust into and be operated by the falling water of the cataract. On the end of the building a tower 150 feet high will be erected. The position of the arms and the entire machinery will be regulated from this vantage point. From the turbine wheels to the building there will be a system of endless chains which will be connected with a large shaft and countershaft. With this it is expected to put the most powerful dynamos, of any required number, in motion. The width of the building will allow the construction of 12 turbine wheels which would give more power than is ever expected to be needed.

Visalia, Cal.—The Mount Whitney Power Company, a company which intends to harness the waters of the Kaweah River, develop electric power and transmit the same to Visalia, Tulare, Porterville, Exeter and Lindsay, is making progress in its great enterprise. The route of the flume for a distance of one mile and a half has been cleared and active work on its construction will soon be commenced. The construction of the flume and power house will proceed simultaneously. Everything that enters into the construction of this gigantic enterprise will be first-class in every particular. Only the best and latest improved electrical machinery will be utilized. The company has awarded the contract to supply the copper wire for the power lines. The company expects to be ready for business early in the spring.

COMPANY MATTERS.

Dallas, Tex.—The receivership proceedings instituted against the Dallas Electric Company by the United Electric Securities Company of Boston have been dropped. By mutual agreement between the Securities Company and the Fort Wayne Electric Corporation all interests of the Fort Wayne company and of R. T. McDonald have passed into the control of the United Electric Securities Company. The management passes into Boston hands. The new company has the following officers: President, Walker Abbott of Boston; vice-president, W. H. McGrath of Dallas; secretary and treasurer, John Frost. The directory is composed of the president, vice president, secretary and treasurer and Robert Treat Paine and Gordon Abbott, both of Boston.

Dolgeville, N. Y.—Senator-elect James D. Feeter of Little Falls has been appointed permanent receiver of the Dolgeville Electric Light & Power Company. It is understood that the company is now making considerably more than its expenses.

St. Louis.—John H. Blessing, secretary and one of the directors of the Central Traction Company, is reported in the "Star" as saying that a deal involving the sale of the Central Traction Company's interests in St. Louis to Brown Bros. of New York, acting for a syndicate, had been consummated. The Central Traction Company holds a valuable franchise for street car lines in the city, but as yet has none in operation.

PERSONAL AND MISCELLANEA.

Lieutenant-Commander S. Dana Greene of the New York Naval Militia has been detailed as an aide on the staff of Governor Roosevelt. Lieutenant-Commander Dana entered the United States Naval Academy in June, 1879, and graduated at the head of his class in June, 1883. He was commissioned ensign two years later but resigned from the navy in 1888. Three years afterwards he joined the Naval Militia. At the outbreak of the war with Spain he re-entered the United States Navy, being appointed junior lieutenant. He served on board the lively cruiser Yankee during the Santiago campaign and was honorably discharged on September 6. He was subsequently reappointed lieutenant-commander and chief of staff of the captain of the Naval Militia. Lieut.-Com. Greene is well known in electrical circles as an official of the General Electric Company.

Edward M. Hayward, an electric light trimmer in the employ of the Worcester Electric Light Company, was electrocuted a few days ago while at work trimming a lamp at the Holyoke Machine Works in Worcester, Mass. The current had not been turned off, and standing on damp ground, without gloves on his hands, the unfortunate man received a shock which caused his death within a few minutes. Hayward had been in the employ of the company for seven years and was regarded as a faithful workman, but as in the case of railroad brakemen, he had become so accustomed to face danger that he gradually neglected the usual precautions and so lost his life.

The employes of the Newport News & Old Point Railway & Electric Company, formerly the Newport News, Hampton & Old Point Railway Company, were treated to a startling surprise on Christmas eve by the president of the old company, J. S. Darling. The men were summoned to be at the power house in Newport News at 1 o'clock A.M., and to a man they expected to receive their discharges from the new management. They were astonished to find waiting for them there checks for varying sums, the gift of Mr. Darling and his son, who sold out to the new company. The sum of $16,000 was divided among thirty employes, the amounts of the checks being based on the time of service. One man received a check for $1,000, several conductors received each $750, others received $400 and $500, and the rest amounts large and small. The old president, who is one of the richest men in that section of Virginia, made a speech to the men, some of whom were moved to tears at his generosity.

A few nights ago in Brooklyn, the fuse box of a trolley car burned out, the lights were extinguished and the car came to a standstill. Investigation showed that the trolley pole had become entangled with the "L" road structure. Most of the passengers, many of whom were women, fled from the car in fright and stood about it. The motorman found that the accident was due to the loss of a pin from the wheel on the end of the pole, and after surveying the situation begged the women standing about for three hairpins. With two of these he repaired the fuse box and then climbing on top of the car replaced the wheel and put in the other hairpin in place of the missing cotter pin. It answered the purpose, and after a half hour's delay the car went on its way as far as the barns, where it was taken off for repairs.

At mines where electric plants are installed for the operation of coal cutting machines, locomotives, drilling and so forth, the application of electric motors is constantly being extended and applied to apparatus which a few years ago presented no encouragement for the electrical engineer. The least encouraging of these was the coke oven "larry," says "Mines and Mining." Due to the conditions under which the "larry" has to operate it does not seem advisable to attempt to use an electric motor to propel it along the coke ovens. There was apparently no advantage to be gained by reduction in expense of operation, and the owners of coal mines operating coke ovens were not encouraged to adopt this means of propelling the "larry." Subsequent experience has shown, however, that the device is economical and practical, as was demonstrated by the adoption of the system at the mines of the Pulaski Iron Company in West Virginia, making a locomotive out of it and entirely doing away with the use of mules about the coke ovens. The increased rate of travel allows the ovens to be charged more rapidly, and a less number of larries are required than when mules are used.

RECENT COMPANY ELECTIONS.

Albany, Helderberg & Schoharie Electric Railway Company, Albany, N. Y.—President, H. W. Burgett of Brookline, Mass.; vice-president, B. M. Secor, Albany; secretary, William H. Irwin, Albany; treasurer, Charles E. Bibbew, Boston, Mass; directors: H. W. Burgett, B. M. Secor, R. J. McCauley, Thomas J. Wood, Berne; E. Twitchell, Schoharie; H. W. Smith, W. H. Irwin, James M. Borthwick, Charles H. Brown, Rufus H. Sawyer, O. L. Brown, Boston; O. F. Plank, Gallupville.

Albion Electric Light Company, Albion, Mich.—President, E. P. Robinson; vice-president, A. J. Galo; secretary, A. N. Foote; treasurer, W. O'Donoghue; manager, W. A. Foote.

Chattanooga Terminal Railway Company, Chattanooga, Tenn.—President, T. J. Nicholl; vice-president, Frank Spurlock; treasurer, John Orr; secretary, H. C. Beck; directors: the officers and W. G. M. Thomas.

New Orleans City & Lake Railroad Company, New Orleans.—President, Albert Baldwin; president pro tem., R. M. Walmsley; secretary, A. H. Ford; directors: Albert Baldwin, R. M. Walmsley, Frank T. Howard, A. B. Wheeler, C. H. Hyams, J. C. Denis, C. M. Soria, O. Eustis, John W. Castles, R. E. Craig, J. B. Levert, E. G. Schlieder.

People's Electric Light & Power Company, Oswego, N. Y.—President, E. H. Bennett; vice-president, D. L. Couch; treasurer, J. O. Knight; secretary, Allen O. Casler. The officers and C. W. Ott form the board of trustees.

Portsmouth & Dover Railroad Company, Portsmouth, N. H.—President, Frank Jones; treasurer, A. F. Howard; clerk, Calvin Page; assistant treasurer, John W. Emery; directors: Frank Jones, J. Albert Walker, John S. Tilton, Portsmouth; Joseph O. Hobbs, North Hampton; Daniel W. Lawrence, Medford, Mass; Frank A. Christie, William D. Sawyer, Dover.

COMMERCIAL PARAGRAPHS.

Calendars, Etc.

The 1899 calendar of the American Electrical Works, Providence, R. I., which has come to hand, contains an engraved likeness of Prof. Morse set in the ornamental lettering of the company's name. The card as a whole is plain and yet elegant—neat but not gaudy—and in this respect fitly represents a company noted for the sterling quality of its productions and the faultless taste evinced in everything it prints for circulation.

The Okonite Company's calendar is quite pretty. Framed in the gray card to which is appended the monthly notations is a daintily colored lithograph of a handsome French peasant girl, whose arms are loaded with baskets containing sundry products of the farm and dovecote. While pursuing her way to Paris, as we assume, she is attacked by a vicious terrier who has seized her dress in front and is tugging at it with all his strength and with possibilities of disastrous effect which an uplifted umbrella in the hands of the girl inspires the hope may be happily averted. In the meantime some of the doves, taking advantage of the situation, are making their escape from one of the baskets. The moral we suppose is, that Okonite, like the umbrella, can always be relied upon no matter what threatens.

The Standard Underground Cable Company have kindly sent us, with their good wishes, a combination foot rule and wire gauge, which we shall not only prize for its usefulness, but shall preserve as a reminder that the company is still "on the earth" though engaged so extensively in underground undertakings in all parts of the habitable globe wherever a standard wire or cable is used for transmission of electric current.

The Lombard Water Wheel Governor Company, whose office and factory are at 61 Hampshire street, Roxbury District, Boston, Mass., report that the demand for their governors is constantly on the increase. During last month they received orders for upwards of twenty governors to regulate forty-one water wheels which will develop 15,710 horse-power. More than half of this machinery will be used in electric stations—principally in power transmission plants—and electric railway stations, the balance being in textile and other manufacturing plants driven by water power.

The Electric Appliance Company, Chicago, have for distribution to the telephone trade a sample card of such of their celebrated Paranite Wires as are particularly adapted to telephone uses. The card shows samples of No. 19 plain and braided Single Conductor Paranite of a high insulation suitable for telephone work. It also shows samples of No. 19 Duplex Twisted Paranite Wire in three styles, the first being plain with one conductor of red rubber and the other with black rubber insulation; another sample with black and red rubber insulation but braided over with a regular saturated weather-proof braid. There is still another sample of the No. 19 two conductor twisted having red and black rubber insulation, but having glazed braid instead of the saturated braid. These sample cards can be had for the asking.

INCORPORATIONS.

The Canadian Electric Extract Company, Portland, Me. —to manufacture extracts. Authorized capital, $10,000; subscribed and paid, in $70. Incorporators: G. D. Burton, Boston, Mass.; D. H. Williams, Somerville, Mass.

The Richmond Electric Company, Richmond, Ky.—to manufacture all kinds of electric appliances. Capital stock, $10,000. Incorporators: J. W. Cook and others.

The People's Street Railway Company, Chicago, Ill. Capital stock, $10,000. Incorporators: J. W. Latimer, B. R. Reynolds, J. G. Latimer.

The American Electrical Extract Company, Portland, Me.—to manufacture extracts. Authorized capital, $3,000,

000; subscribed and paid in, $60. Incorporators: G. D. Burton, Boston, and L. H. Williams, Somerville, Mass.

The Milo Electric Light & Power Company, Milo, Me.—to supply light, heat, etc., in the towns of Milo, Sebec and Brownville. Capital stock, $10,000. President and treasurer, Julian D'Este, Dover, Me.

The Cuban Electric Company, Asbury Park, N. J.—to manufacture electricity for light, heat and power. Capital stock, $1,000 000. Incorporators: William R. S. Melvin, East Orange, N. J.; G. K. B. Wade, Herbert A. Howell, Henry K. Davis, New York; Francis A. Fuller, Brooklyn.

The South American General Electric Supply Company, Schenectady, N. Y.—to buy electrical apparatus in the United States and sell it in South America. Capital stock, $50,000. Directors: S. D. Greene, H. W. Darling, D. Mazenet, J. R. Lovejoy, M. F. Westover, Schenectady, N. Y.

The San Juan & Rio Piedras Railroad Company, New York—to construct and operate an electric or steam railroad, 7½ miles long, from San Juan to Rio Piedras, Porto Rico. Directors: George H. Walbridge, Fernando G. Echeveddia, H. H. Harrison, Edward Schmidt, Lathrop R. Bacon, F. Kingsbury Curtis, Philip H. McMillan, Augustin N. Hand and William B. Parsons of New York City.

The Electric Power Development Company, Camden, N. J.—to manufacture and supply electricity to municipalities, etc. Capital stock, $500,000. Incorporators: Marcus B. Taylor, Charles W. Kennedy, Isaac Blum, Wm. Findlay Brown and S. Y. Heebner.

The Electric Mining & Reduction Company, Portland, Me.—to manufacture electrical mining apparatus and do a general mining business. Authorized capital, $500,000; subscribed and paid in, $7. Incorporators: E. K. Milliken, Deering; G. D. Burton, Boston; Charles Williams, Jr., Somerville, Mass; L. H. Williams, Brookline, Mass.; George Wallace, Newtonville, Mass; G. W. Stiner, Brooklyn, N. Y.; A. Scidmore, Gloversville, N. Y.

The Canadian Electrical Process Company, Portland, Me.—to manufacture electrical leather-working apparatus. Authorized capital, $10 000; subscribed and paid in, $70. Incorporators: E. K. Milliken, Deering; G. D. Burton, C. H. Kimball, Boston; H. M. Tower, Spencer, Mass.; Charles Williams, Jr., Somerville, Mass; L. H. Williams, Brookline, Mass; George Wallace, Newtonville, Mass.

The Burton Electric International Leather Company, Portland, Me.—to manufacture electrical leather-working apparatus. Authorized capital, $10,000; subscribed and paid in, $70. Incorporators: E. K. Milliken, Deering; G. D. Burton, C. H. Kimball, Boston; H. M. Tower, Spencer, Mass.; C. Williams, Jr., Somerville, Mass; L. H. Williams, Brookline, Mass.; George Wallace, Newtonville, Mass.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED DECEMBER 27, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

616,821. Underground Electric-Railway System. Frederick H. Chamberlain and Griffin B. Coleman, Washington, D. C. Filed Dec. 2, 1897.

616,701. Fender for Street-Cars. Theodore C. Forbes, Chicago, Ill. Filed July 18, 1898.

ELECTRIC LIGHTS AND APPLIANCES.

616,507. Incandescent-Electric-Lamp Socket and Base. Christopher Van Deventer, New York City. Filed April 1, 1898.

616,607. Support and Take-Up Device for Cable-Suspended Electric Lamps. John H. Dorion, Springfield, Mass. Filed June 13, 1898.

616,620. Electric Incandescent Lamp. Henry F. Joel and Ferdinand Fanta, London, England, assignors to the Improved Electric Glow Lamp, Limited, same place. Filed July 29, 1896.

616,770. Lighting or Extinguishing Automatically Incandescent Electric Lamps. Charles S. Cole and John H. Kinsman, Bridgeport, Conn. Filed April 1, 1898.

616,779. Electrical Safety-Lamp for Miners. Carl Francke, Berlin, Germany. Filed April 18, 1898.

ELECTRICAL MACHINERY AND APPARATUS.

616,519. Mold for Forming Armature-Coils. William K. Bassford, Jr., Bound Brook, N. J. Filed July 27, 1898.

616,673. Electric Motor and Method of Controlling Same. Charles W. Kennedy, Rutledge, Pa., assignor to Samuel Y. Heebner, same place. Filed April 22, 1898.

616,861. Automatic Weighing-Machine. Francis H. Richards, Hartford, Conn. Filed Dec. 10, 1897.

616,862. Weighing-Machine. Francis H. Richards, Hartford, Conn. Filed Dec 13, 1897.

616,863. Weighing Machine. Francis H. Richards, Hartford, Conn. Filed Dec. 15, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

616,714. Automatic Telephone-Exchange. Frank A. Lundquist, John Erickson and Charles J. Erickson, Lindsborg, Kan. Filed March 28, 1898.

616,718. Telephone Gravity-Switch. Charles T. Mason, Sumter, S. C., assignor to the Telephone Manufacturing Company, same place. Filed May 3, 1898.

616,755. Binding-Post for Electrical, Telephonic or Telegraphic Instruments. Joseph A. Williams, Cleveland, O., assignor to the Williams Electric Company, same place. Filed May 25, 1898.

MISCELLANEOUS.

616,513. Apparatus for Making Observations by Means of Roentgen or X-Rays. Jacques Wertheimer, Paris, France. Filed Nov. 19, 1897.

616,612. Armored Electric Cable. Edwin T. Greenfield, New York City. Filed April 13, 1898.

616,669. Recording Device for Measuring Instruments. Adrian H. Hoyt, Penacook, N. H. Filed Aug. 13, 1897.

616,722. Railway Signaling Device. Francis M. Myers, Windsor, Mo., assignor of one-half to Charles A. Draper and Joseph S. Calfee, same place. Filed April 2, 1898.

616,801. Electric Heater. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car Heating Company, same place. Filed Oct. 13, 1898.

DESIGN.

29,891. Front Plate for Electric Heaters. Edward E. Gold, New York City. Filed Oct. 25, 1898.

TELEPHONE AND TELEGRAPH.

Independent Telephone Movement.

"Occasionally the people of Chicago are reminded," says the Chicago *News*, "that elsewhere an earnest effort is being made to break the power of the old telephone monopoly, although that institution is as formidable in this city to-day as at any period in its history. While the local Bell company is complacently increasing the rates for those who cannot tolerate the defective service provided by the antiquated 'ground-return' system and are therefore compelled to pay an additional fee of $50 for complete metallic-circuit instruments, the Bell interests at other points are confronted by determined opposition.

"It cannot now be said that the independent movement is confined to small places, for companies have been organized and service is being given in many large cities. In St. Louis, for instance, the Kinloch Company has more paid subscribers on its list than the Bell Company has ever had in that city, and the Kinloch has only recently completed its system. The new service is pronounced satisfactory in every respect and the rental is only $60 per year. A similar system is now being introduced into Indianapolis, and Cleveland is working along similar lines. Detroit has long had an independent company, which outranks the Bell concern in importance, and other towns have found the independent service far preferable to the old order. In New York the Board of Trade and Transportation, which has been fighting the Bell monopoly for years, has pledged its support to an independent company. Boston has just granted a franchise to an anti-Bell corporation which agrees to furnish first-class service at a maximum rental of $72 per year. It is claimed by conservative telephone experts that $75 per year would be a fair rental for modern telephone service in Chicago."

S. P. Sheerin, one of the chief promoters of the New Telephone Company, who had been in attendance at the meetings of the independent telephone exchanges of Eastern Illinois and Western Indiana, at Paris, Ill., on the 21st ult., returned to Indianapolis accompanied by A. F. Ramsey and George W. Beers, representing the associated independent telephone lines of Indiana. The object of the Indiana men at the meeting was to secure an agreement by which the toll business would be interchanged between the Illinois and Indiana independent lines. The Illinois lines represented at the meeting controlled 10,000 telephones and about 2,000 miles of toll lines. During the meeting representatives of the Central Union and Bell Telephone companies made overtures similar to those rejected by the Indiana independent companies at Lafayette. None of the propositions were received with favor and, after short speeches against making any arrangement with the old companies, were rejected. The following exchanges were represented at the meeting: Oakland, Kansas, Mattoon, Sullivan and Cole county, Hume, Sidel, Clinton and Danville, Ill; Chrisman and Dana, Ind.; Ridge Farms, Paxton, Watseka, Hoopeston, Paris and Charleston, Ill., and the Citizens' of Terre Haute, Ind.

"The fact is well deserving of note," says the *N. Y. Sun*, "that at one of its recent meetings the Franklin Institute of Philadelphia awarded the Longstreth medal to Thomas B. Doolittle, well and widely known in telephone circles for his hard-drawn copper wire, a most important contribution, it is hardly necessary to say, to all electrical industries. This wire, while retaining those properties of conductivity inherent in copper, has the additional quality of great tensile strength, and it is the opinion of those qualified to judge that, without this discovery, long distance telephony and the electrical transmission of energy over long distances would be impossible—in a word, the value of this process and its extensive application is sufficiently evident from the fact that the annual consumption of hard drawn copper wire in the United States alone exceeds eighty million pounds. With the caution demanded by the subject, the Franklin Institute waited until it had made an exhaustive examination of the case, and until the value of the discovery had been amply proved."

In the Circuit Court at Baltimore on the 28th ult., Judge Wickes signed a decree for the sale of the property of the Home Telephone & Telegraph Company in Baltimore. It provides that the sale shall take place after three weeks' notice by advertisement, and that no bids less than $125,000 shall be received. The operation of the decree was suspended by the Court until January 2, by which time it was hoped that arrangements for the reorganization of the company might be made by the stockholders. The upset price of $125,000 named in the decree, it is said, exceeds the company's liabilities, including its bonded indebtedness, with interest, of $90,000. The Home Company operates the only opposition telephone service in Baltimore and has upwards of 1,500 subscribers.

At Des Moines, Ia., the city on the 23d ult. filed a petition in the District Court asking for an injunction to restrain the Iowa Telephone Company from building additional lines in the city, and for an order directing that all poles and wires of the defendant company be removed from the streets and alleys of the city at the cost of that company. The city claims that the Iowa Telephone Company is operating without a franchise. Judge Holmes, to whom the petition was presented, has issued an order directing the defendant to appear at 10 A.M. on January 9 and show cause, if any, why a temporary injunction shall not issue.

The N. Y. *Commercial* of the 30th ult. says: "The Merchants' and Manufacturers' Board of Trade, which has its headquarters in the Hoffman House, through its Telephone Committee will launch next week a crusade against extortionate rates, which is designed to bind together all the telephone-reform associations in the United States, to sow the seeds of other associations, and to bind them all into a league of great power and influence. The members of the Telephone Committee are O. C. Shayne, Andrew Patterson, Francis O'Neill, Charles Hickman, C. Du Brull and J. A. Hickman, secretary of the Board, all prominent business men.

A press dispatch from Tuscola, Ill., dated the 1st inst., states that the Bell Telephone Company has just succeeded in absorbing the Interstate Telephone Company, which had headquarters in Tuscola. The Interstate Company, the dispatch states, owned and operated several hundred miles of lines in Central Illinois, and as the Bell Company threatened to cover the same territory a compromise was effected whereby the Interstate goes out of existence.

The Chicago *Economist* says that John D. Rockefeller of the Standard Oil Company is interested to the extent of over $500,000 in the new Home Independent Telephone Company of Cleveland, Ohio, which is being promoted by H. A. Everett. Mark Hanna is also reported to be heavily interested in the project.

Major Dunwoody of the Signal Service has arrived in Havana and has been ordered to report for duty as Chief Signal Officer on General Brookes' staff. He will have charge of all telegraph and telephone lines in Cuba, and the island's business in this line will be run by the Government during the military occupation.

The New Haven (Conn.) *Commercial Register* states that S. Harrison Wagner and ex-Governor Waller are mentioned as being interested in the plans on foot to establish a new telephone company as a rival corporation to the Southern New England Telephone Company.

At a recent special meeting of the board of mayor and aldermen of Asheville, N. C., an order was issued, restraining the Bell Telephone Company from interference with the Asheville company in the work of putting in a new telephone system.

The Duluth Telephone Company's new telephone line between Duluth, Carleton and Cloquet, Minn., was formally opened on the 21st ult. It affords long distance service.

Albert B. Chandler, president of the Postal Telegraph & Cable Company, has been elected a director of the Erie Telegraph & Telephone Company.

New Companies Incorporated.

The Independent Telephone Company, Waco, Tex.—to construct telephone lines and maintain exchanges throughout the State of Texas. Capital stock, $75,000. Incorporators: Sam Sanger, Ed. N. Stephenson, J. B. Earle, J. E. Boynton, W. M. Seley and E. Rotan.

The Audubon & Kimballton Telephone Company, Audubon, Ia.—to establish a telephone line connecting Audubon and Kimballton with Elkhorn, Poplar and Sharon Cemetery. Capital stock, $900. Incorporators: Pede Lykke and others.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 12.65@12.75c.; Lake, 12.75@13c.; casting, 12.65@12.75c.

The Southern Electric Railroad of St. Louis declared a semi-annual dividend of 3 per cent., payable on the 2d inst.

The North Chicago Street Railway Company has declared a dividend of 3 per cent., payable on and after January 15.

The Mexican Telegraph Company has declared a quarterly dividend of 2½ per cent., payable January 13. Books reopen January 14.

The Sprague Electric Company of Watsessing, N. J., with a capital of $5,000,000, has been licensed to do business in Illinois with a capital of $2,000.

The Central & South American Telegraph Company has declared a quarterly dividend of 1½ per cent., payable January 6. Books reopen January 7.

Application has been received at the New York Stock Exchange to list $2,000,000 Edison Electric Illuminating Company of Brooklyn first consolidated mortgage coupon bonds of 1939.

The electric railroad known as the Los Angeles & Pasadena Railroad Company, operating between Los Angeles and Altadena, Cal., has passed into the possession of the Southern Pacific Company, the purchase price being $1,000,000.

The Columbia Street Railway, Washington, D. C., has placed a mortgage for $500,000 on its line in favor of the American Security & Trust Company, to secure 500 bonds of $1,000 each, for the purpose of extending its lines on Bennings road.

The American Bell Telephone Company has sold $3,000,000 of its 4 per cent. 10-year debenture bonds to Lee, Higginson & Co., R. L. Day & Co., and Estabrook & Co. The total issue is $10,000,000, and the present sale makes $8,000,000 outstanding.

The stockholders of the National Electric Car Lighting Company will meet at the office, 30 Broad street, New York, on January 5 to vote on the proposition to issue $500,000 preferred stock. The present capital is $2,000,000, all common, and all in shares of $50 each.

Thirteen thousand shares of Brooklyn City Railroad stock were sold at auction on Wednesday last at the New York Real Estate Salesroom by Andrew H. Muller & Son, auctioneers. The stock brought from 242¼ to 242½. It was bought by H. A Eaton, who, it was reported, acted for the Mutual Life Insurance Company.

The United Electric Securities Company, Boston, will receive proposals until January 6 for the sale of as many of its collateral trust 5 per cent. bonds as can be purchased with the following amounts of cash: Third series, $36,021; fourth series, $26,091; sixth series, $1,470; seventh series, $1,943; total, $65,526.

The Safety Car Heating & Lighting Company has declared a regular a semi-annual dividend of 3 per cent., and an extra dividend of 2 per cent. This will make 8 per cent. payments for the year. It is understood that it is the intention of the management to put the company's stock on a regular annual basis of 8 per cent.

An electric light company has been incorporated at Harrisburg, Pa., to take over all the companies controlled by the Pennsylvania Manufacturing, Light & Power Company of Philadelphia. The proposed capital is $25,000,000 stock and $10,000,000 bonds. It is proposed to call an installment of 10 per cent. when the shares are issued. The securities are to be listed on the Philadelphia Stock Exchange.

Secretary of State Hay has officially announced his disapproval of the contract entered into between the Hawaiian Government (subject to the approval of the United States) and the Pacific Cable Company of New York. The action of the Secretary is in accordance with the terms of the contract, which provides that it shall not take effect if disapproved by the State Department within six months from July 2, 1898.

The reported "absorption" by the North Jersey Railway Company of the North Hudson Street Railway Company of Hudson County, N. J., is thus explained by Bernard M. Shanley of Newark, who is manager of the North Jersey Company and a large stockholder of the company: "For upward of five years I have owned, with others, a quarter interest in the North Hudson Company, and now we have purchased from J. O H. Pitney enough of the stock of the company to secure us the controlling power; but the company will be run as the North Hudson Company and will be entirely independent of the North Jersey Company."

The Cleveland (O.) Electric Railway (Big Consolidated) directors have again declared a quarterly dividend of 1 per cent., payable January 5. This was generally expected, though many thought the increase in the last dividend was to boom the stock, as the earnings were not supposed to be large enough to keep it up. The gross earnings for 1898 are only slightly ahead of 1897, but the net earnings show a marked increase over that year. The annual meeting for the election of officers is expected to take place on January 18. The stockholders of the Little Consolidated will have their annual meeting to elect officers January 9.

The Baltimore "News" of the 29th ult. says: "The opinion prevails in financial circles that the deal involving the consolidation of the railway systems is off for the present, though negotiations may be resumed at any time. There have been no conferences between Mr. Nelson Perin, representing the Consolidated, and Mr. Alexander Brown, representing the syndicate, since the announcement of the hitch in the deal. This was one week ago last Saturday. Neither Mr. Perin nor Mr. Brown will admit that negotiations have been broken off, though there is no doubt that the hitch is serious, but whether serious enough to defeat the amalgamation of the properties is a question that time will decide."

The Buffalo General Electric Company has, says the "Financial Chronicle," called for redemption at 104 and interest its entire issue of 6 per cent. bonds of 1892, and will pay them off on February 1, 1899. The authorized amount of this loan is $2,400,000, but only $1,575,000 have been issued. In addition there is outstanding a small loan of the old Thomson-Houston Company, one of the companies absorbed, which is due February 1, 1900, making the Buffalo Company's total funded debt about $2,000,000, all represented by 6 per cent. bonds. These will be refunded into new forty-year 5 per cent. gold bonds, effecting a substantial decrease in the fixed charges. More than 95 per cent. of the holders of the old 6s of 1892, it is stated, have agreed to exchange their present holdings for the new bonds. The Fidelity Trust & Guaranty Company of Buffalo has the matter in charge.

The capitalization of the companies merged by the big gas deal which has been announced from Philadelphia is: Consolidated Gas Company, $6,500,000 in shares and $5,000,000 in 5 per cent. bonds; the preferred stock is $4,000,000, guaranteed 6 per cent., and the common, $2,500,000; the Philadelphia Company, $7,500,000; the Allegheny County Electric Light Company, $1,500,000; the Allegheny Heating Company, $500,000; the Chartiers Valley Gas Company, $4,000,000, and the Pennsylvania Natural Gas Company, $1,000,000—a total of $26,000,000. Mr. Westinghouse, as reported in the Pittsburg "Leader," states "that Messrs. Brown Bros. & Co. of New York have exercised their option to purchase the stock of the Philadelphia Company at $40 per share and the stock of the Allegheny County Electric Light Company at $180 per share, and that contracts have been duly signed whereby all of the details will be concluded on or before March 1, 1899. Notices will be forthwith mailed to all stockholders of both companies, who will be required to deposit their shares on or before January 15 in exchange for negotiable receipts."

READING ELECTRICAL MFG. CO.,

739 Penn Street, Reading, Pa.

NEW BOOKS OF INTEREST TO ELECTRICIANS.

ELLIOTT.—INDUSTRIAL ELECTRICITY. Translated and adapted from the French of Henry de Graffigny and edited by A. G. Elliott, B. Sc. With numerous Diagrams. 12mo. Cloth. pp. viii+152. **Price, 75 cents.**

Whittaker's Electro-Mechanical Series.

This is the first of a series of handbooks upon Electro-Mechanics to be issued from time to time. It is believed that there is room for these volumes, because they explain in very clear and non-mathematical language the many and various applications of electricity. The present volume may be accounted as introductory to the rest of the series. It is divided into short chapters, each dealing with a separate branch of practical electricity.

HYNDMAN.—RADIATION. An Elementary Treatise on Electromagnetic Radiation and on Roentgen and Cathode Rays. By H. H. Francis Hyndman, B. Sc. (London). With a preface by Prof. Silvanus P. Thompson, D. Sc., F. R. S. 12mo. Cloth. pp. xviii+307. **Price, $1.60,** *net.*

STILL.—ALTERNATING CURRENTS OF ELECTRICITY AND THE THEORY OF TRANSFORMERS. By Alfred Still, Assoc. M. Inst. C. E. With numerous Diagrams. 12mo. Cloth. pp. vi+184. **Price, $1.50.**

On account of the unsuitability of analytical methods for the solution of alternating current problems, graphical methods have been used throughout; and the introduction of mathematics has been entirely avoided in the present work.

TREADWELL.—THE STORAGE BATTERY. A Practical Treatise on the Construction, Theory and Use of Secondary Batteries. By Augustus Treadwell, Jr., E. E., Assoc. M. A. I. E. E. With many illustrations. 12mo. Cloth. pp. xix+257. **Price, $1.75,** *net.*

A book containing compact data concerning the construction of the many cells which have been and are on the market, together with rules for the handling and maintenance of cells, of great value not only to the student and manufacturer but also to all interested in storage batteries, a compilation of the latest and most accurate data on the subject.

STANDARD BOOKS FOR ELECTRICIANS.

BEDELL.—THE PRINCIPLES OF THE TRANSFORMER. By Frederick Bedell, Ph. D., Department of Physics in Cornell University. 250 illustrations. 8vo. Cloth. pp ix+46. **Price, $3.25,** *net.*

OPINIONS OF THE PRESS.

To gather all this into one book, and to formulate a definite and intelligible scheme out of the multifarious and often contradictory material at hand, was not an easy task, but the author has entirely succeeded. To the student and to the practical maker of transformers the work is invaluable.—*The Automotor.*

The same clearness of reasoning and lucidity of style which have justly rendered the previous work [Bedell and Crehore's *Alternating Currents*] popular among students are apparent in this volume also.—*American Journal of Science.*

Before its appearance the student was compelled to rely upon books which were illogical collections . . . hastily thrown together in book form. [One] should recognize the endeavor of Professor Bedell to bring order out of chaos in presenting the fundamental equations . . . in such a clear and instructive manner.—*Professor Trowbridge in The Electrician.*

WEBSTER.—THE THEORY OF ELECTRICITY AND MAGNETISM. By A. G. Webster, A B (Harv.) Ph. D. (Berol.), Assistant Professor of Physics, Director of the Physical Laboratory, Clark University, Worcester, Mass. 8vo. Cloth. pp. xii+576 **Price, $3 50,** *net.*

THOMPSON.—ELEMENTARY LESSONS IN ELECTRICITY AND MAGNETISM. By Silvanus P. Thompson, D. Sc., B. A., F. R. A. S. Revised Edition. With Illustrations. 16mo. Cloth. **$1.40,** *net.*

"I have read it carefully, and think that a book already good has been made better. Professor Thompson has the power of putting the really important things in their proper places."—James W. Moore, Professor of Physics, Lafayette College, Easton, Pa.

"I consider Thompson the best book of its size and nature on the subject of electricity, and have had frequent occasion to recommend it to friends and students. It is the only book that is not simply a rearrangement or reproduction of the old treatise."—William A. Hallock, Ph. D., Columbia University, New York.

JACKSON.—A TEXT-BOOK ON ELECTRO-MAGNETISM AND THE CONSTRUCTION OF DYNAMOS. By Dugald C. Jackson, B. S., C. E., Professor of Electrical Engineering, University of Wisconsin. 12mo. Cloth. **Price, $2.25,** *net.*

JACKSON.—ALTERNATING CURRENTS AND ALTERNATING CURRENT MACHINERY. By Dugald C. Jackson, C. E., Professor of Electrical Engineering in the University of Wisconsin, and John P. Jackson, M. E., Professor of Electrical Engineering in the Pennsylvania State College. 12mo. Cloth. pp. xvii+729. **Price, $3.50,** *net.*

"I like the way in which they develop their theory and make practical applications. I feel sure that the book will receive a hearty welcome."—George W. Patterson, Jr., Assistant Professor of Physics, University of Michigan.

Send for a copy of our new Classified Catalogue, or of Section VII alone, in which is a list of our publications on the various sciences, many of which are indispensable to the library of any electrician or engineer. It will be sent to any applicant without charge.

BOOK LIST.

Part I.

Allsop, F. B. Electrical Bell Construction, Treatise on the Construction of Electric Bells, Indicators, and similar apparatus. 177 Illustrations, 12mo, cloth. London, 1890 .... 1 25

Ayrton, W. E. Practical Electricity; a Laboratory and Lecture Course for First-year of Students of Electrical Engineering, based on the Practical Definitions of the Electrical Units. With numerous Illustrations. 12mo, cl. London, 1889 .... 2 50

Badt, F. B. The Dynamo Tenders Hand-Book, with 70 illustrations, 16mo, cloth, Chicago, 1888 .... 1 00

—— **and Carhart, Prof. H. S.** Derivation of Practical Electrical Units. 12mo, cloth. Chicago, 1890 75

Bell, Dr. Louis. The Elements of Practical Electricity. In press......

Benjamin, Park. The Age of Electricity. From Amber-soul to Telephone. 12mo, cl. New York, 1888 .... 2 00

Bennet, A. R. The Telephoning of Great Cities and an Electrical Parcel Exchange System. Two Papers read before the British Association at Cardiff. Revised edition. Numerous diagrams. London, 1892 40

Blakesley, T. H. Papers on Alternating Currents of Electricity for the Use of Students and Engineers. Second edition, enlarged. 12mo, cloth. London, 1889 .... 1 50

Bonney, G. E. Electro-Plater's Hand Book. A Manual for Amateurs and young Students on Electro-Metallurgy. 60 illustrations. 12mo, cloth. London, 1891 .... 1 20

Bottone, S. R. Electrical Instrument Making for Amateurs. A Practical Handbook, with 48 illustrations. Fourth edition. Enlarged by a chapter on The Telephone. 12m, clo. London, 1890. Reduced to 50

—— The Dynamo, How Made and How Used. A Book for Amateurs. Sixth edition, with additional matter and illustrations. 1 00

—— Electric Bells and all about them. A Practical Book for Practical Men, with more than 100 illustrations. 12mo, cl. 50

—— Electro-Motors. How Made and How Used. A Hand-Book for Amateurs and Practical Men. Many Illustrations, 12mo, cloth. London, 1890. Reduced to 50

—— A Guide to Electric Lighting, for the Use of Householders and Amateurs. Ill. 12mo, cloth. London and N. Y., 1892 75

Cavendish, H. Electrical researches. Edited by J. Clerk Maxwell. 8vo, cl. Cambridge, 1879 .... 5 00

Crocker, F. B. and S. S. Wheeler. The Practical Management of Dynamos and Motors. Illustrated, cl. N. Y., 1892. In press ....

Crosby, O. T. and Dr. Louis Bell. The Electric Railway in Theory and Practice. A complete Treatise on the Construction and Operation of Electric Railways. Illustrated, cloth. New York, 1892 .... 2 50

Cumming, L. Electricity treated Experimentally. For the use of Schools and Students. New edition. 12mo, cloth. London, 1890 .... 1 50

Desmond, Charles. Electricity for Engineers. 12mo 2 50

De La Rive, A. Treatise on Electricity, in Theory and Practice. Translated by C. V. Walker, 3 vols. 8 vo, cloth, London, 1853 .... 25 00

Dolbear, Prof. A. E. The Telephone. An Account of the Phenomena of Electricity, Magnetism and Sound, as Involved in its Action, with directions for making a Speaking Telephone. 16mo, cl. illustrated. Boston, 1888 50

Electricity in Daily Life. A popular Account of the Science and Application of Electricity to Every-day Uses. With 120 Illustrations. 8vo, cloth. N. Y., 1890 .... 3 00

Emtage, W. T. A. An Introduction to the Mathematical Theory of Electricity and Magnetism. 12mo, cloth. Oxford, 1891. 1 90

Ewing, Prof. A. J. The Magnetic Induction in Iron and other Metals. 159 Illustrations. 8vo, cloth. London, 1891 .... 4 00

Faraday, M. Experimental Researches in Electricity. 3 vols. 8vo, cl. London, 1839-55 .... 25 00

Fiske, Lt. Bradley, A., U. S. N. Electricity in Theory and Practice, or The Elements of Electrical Engineering. 8th ed. 8vo, cl. 180 illustrations. N. Y., 1891 .... 2 50

Fleming, J. A. Short Lectures to Electrical Artisans. A course of Experimental Lectures delivered to a Practical Audience. 3d Ed. 74 illustrations. 12mo, cl. 1890 .... 1 50

Forbes, Prof. Geo. A Course of Lectures on Electricity. Delivered before the Society of Arts. 82 illustrations. 12mo, cl. London. 1887 .... 1 50

Gladstone, J. H., and Alfred Tribe. The Chemistry of the Secondary Batteries of Planté and Faure. 12mo, cl., illustrated. London, 1883 .... 1 00

Gordon, J. E. H. A Practical Treatise on Electric Lighting. With 23 full-page plates and many illustrations. 8vo, cl. London, 1884 .... 4 50

—— Four Lectures on Static Electric Induction. 12mo, cl., ill. 50

—— A Physical Treatise on Electricity and Magnetism. Second Edition 2 vols., 8vo, cl. Illustrations and plates. N. Y. 10 00

—— School Electricity. Sources, Currents, Measurement, Teleraphy, Telephony. Lightning, Electrolysis, Induction, etc., 262 pages, with 140 illustrations, 12mo, cloth. London, 1886 .... 2 00

Gardon, Mrs. J. E. H. and J. E. H. Decorative Electricity. With a chapter on Fire Risks. (New and cheaper edition). London, 2 40

Gore, G. The Art of Electro-Metallurgy, including all Known Processes of Electro-Deposition. Fourth edition. 12mo, cl., ill. 2 00

Gore, G. Theory and Practice of Electro Deposition, including every known mode of depositing Metals—Preparing Metal and for Immersion—Inking Moulds and rendering them Conducting. 12mo, cl. London, 1887 80

—— The Art of Electric Separation of Metals, Theoretical and Practical. Fully Illustrated, 8vo, cloth. London, 1890 .... 3 50

Haskins, C. H. The Galvanometer and its Uses. A Manual for Electricians and Students. 4th edition, revised. 12mo, mor., ill. 1 50

Hedges, K. Central Station Lighting. Notes on Methods used for the Distribution of Electricity. Illustrated. 12mo, cl. London, 1889 .... 1 25

Herring, Carl. Principles of Dynamo Electro Machines; Practical Directions for Designing and Constructing Dynamos. With an Appendix containing several Articles on allied subjects, and a table of equivalents of Units of Measurement. With 59 illustrations. 12mo, cl. N. Y. 1888 .... 2 50

—— Table of Equivalents of Units of Measurements. 12mo, paper. New York, 1888 50

Hopkinson, Dr. John. Dynamic Electricity: Its Modern Use and Measurement, chiefly in its Application to Electric Lighting and Telegraphy; including I., some Points in Electric Lighting. II. On the Measurement of Electricity for Commercial Purposes. By J. N. Shoolbred. III. Electric Light Arithmetic. By R. E. Day. 16mo, boards 50

Hospitalier, E. Domestic Electricity for Amateurs. Translation from the French. With additions, by C. S. Wharton. With illustrations. 8vo, cl. London, 1889 .... 2 50

Houston, Prof. E. J. A Dictionary of Electrical Words, Terms, and Phrases. 8vo, 750 pages. Illustrated, cloth. N. Y., 1892... 5 00

Induction Coils. How Made and How Used. 16mo, boards. N. Y., 1881. 50

Incandescent Electric Lighting. A practical description of the Edison system, by L. H. Latimer, to which is added a description of the Edison Electrolytic Meter, by A. E. Kennelly, and a paper on the maximum efficiency of Incandescent Lamps, by John W. Howell. 16mo, boards. New York, 1890 .... 1 25

Jamieson, A. Elementary Manual of Magnetism and Electricity. Specially arranged for the use of First Year Science and Art Department and other Electrical Students. With numerous illustrated experiments and examination questions. 2nd edition. 12mo, cloth. London, 1891 .... 1 25

Jenkin, Fleming. Electricity and Magnetism, with an Appendix on the Telephone and Microphone. 9th edition. 12mo, cl. London, 1886 .... 1 25

SITUATIONS WANTED.

Free Advertising.

Inquiries from those seeking employment as Electrical Engineers, Superintendents, Foremen, Salesmen, Dynamo-tenders, Constructing and Designing Engineers, Electro-metallurgists, or in other positions requiring technical experience or intimate acquaintance with the electrical trade, will be inserted in this column Without Charge. Each advertiser is invited to repeat his advertisement in case the first one produces no results.

It is the desire of the management of this paper to bring the unemployed and the employer together to their mutual benefit, and to this end they invite the former to make use of this column without charge. No advertisement exceeding five lines (about 35 words) will be inserted, but advertisers may write fully of their qualifications and these letters will be kept on file for future reference in filling vacancies which may occur.

Applicants should write clearly and distinctly and enclose postage to insure attention.

Address all communications to Free Advertising Editor, "Electricity," New York.

71 WANTED.—Position by a graduate electrical engineer as superintendent of construction or operation of an electrical plant or factory; five years' experience operating and installing direct and alternating machines; at present manager of a plant but wish to better myself; reliable and efficient; use no intoxicants; strict attention to business; not afraid of work; ambitious; salary reasonable; A1 references; go anywhere. Address P. E., care ELECTRICITY.

72 WANTED.—Position as chief engineer of waterworks or electric light plant, or both, in West or South, by an engineer who has had considerable experience in the economical management of steam plants and machine shops; can furnish first class testimonials for sobriety, honesty and ability. Address C. M., care ELECTRICITY.

73 WANTED.—Position by a young man with best reference; six years' experience in all work connected with a telephone exchange; thoroughly familiar with construction in all its branches; can take entire charge if desired; present position for five years; am not afraid of work. Address A. G. S., care ELECTRICITY.

74 WANTED.—Position as draughtsman and engineer by young man of technical education and extensive practical experience in design and construction of alternating and direct current generators, transformers and large switchboards; thoroughly familiar with all details of the business. Address C. S., care ELECTRICITY.

75 WANTED.—Position by a first-class all-around armature winder; thoroughly experienced in the Thomson-Houston, Edison, Brush and General Electric Company systems; 10 years' experience in the construction of dynamos and motors; three years' foreman in this capacity, and has thorough practical knowledge of all the different windings. Address WESTMINSTER, care ELECTRICITY.

76 WANTED.—A Stevens graduate, mechanical and electrical engineer and draughtsman, desires employment; have had four months' special work with leading electrician; can furnish best of references. Address K. D. E., care ELECTRICITY.

77 WANTED.—A technical graduate in electrical engineering would like work in some branch; low salary; no objections to foreign country. Address ORONO, care ELECTRICITY.

78 WANTED.—Young man, 25 years old, with over 7 years' experience in the design and construction of bridges and structural work, power houses and electrical railway work, both overhead and underground conduit systems, wishes position. Address J. H. G., care ELECTRICITY.

79 WANTED.—A young man, electrical engineer, graduate of Lehigh University, desires a position with a manufacturing plant, power station, or any capacity where merit will be rewarded. Address O. F. care ELECTRICITY.

80 WANTED.—Position where I can learn to be an electrical engineer; I am 17 years old and have no experience, but I am going to Cooper Union to learn all I can. Address M. D. care ELECTRICITY.

81 WANTED.—Position as engineer for waterworks or electric light plant by a graduate mechanical engineer with special ability for business and management; practical hustler; best of reference as to ability, energy and character. Address BUTTE, care ELECTRICITY.

When writing to advertisers kindly mention ELECTRICITY.

POSITIONS VACANT.

Free Advertising.

Inquiries from employers in want of Electrical Engineers, Superintendents, Foremen, Salesmen, Dynamo-tenders, Constructing and Designing Engineers, Electro-metallurgists, or other assistance from those possessed of technical experience in the various electrical lines, will be inserted in this column Without Charge, whether subscribers or not.

Applicants should enclose the necessary postage to insure the forwarding of letters.

Address all communications to Free Advertising Editor, "Electricity," New York.

WANTED.—All around electrician; prefer one who can invest a little capital so as to buy part ownership in an old paying business; big chance; investigate. Address M. P. C., care ELECTRICITY.

WESTON

Standard Portable Direct-Reading

VOLTMETERS, MILLIVOLTMETERS,
VOLTAMMETERS, AMMETERS,
MILLIAMMETERS, OHMMETERS,
GROUND DETECTORS and CIRCUIT TESTERS,
PORTABLE GALVANOMETERS.

Our Portable Instruments are recognised as THE STANDARD the world over. The SEMI-PORTABLE LABORATORY STANDARDS are still better. Our STATION VOLTMETERS and AMMETERS are unsurpassed in point of extreme accuracy and lowest consumption of energy.

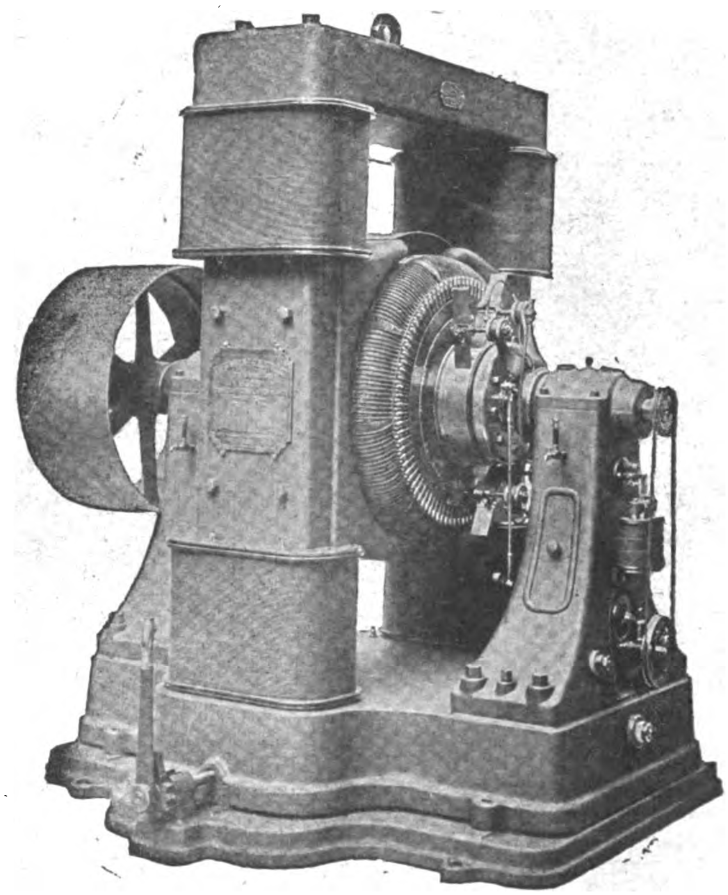
Weston Electrical Instrument Company,

114-120 William Street, NEWARK N. J., U. S. A.

FORT WAYNE ELECTRIC CORPORATION,

FORT WAYNE, IND.

Apparatus for Light and Power.



No. 10 "Wood" Arc Dynamo.

Embodies all the latest improvements in electrical machinery. Has many superior advantages. Is simple and durable.
